

Synerduino Shield

Differential propulsion for Tanks and Boats

Hardware

- Synerduino shield
- Arduino2560 MEGA
- Tank or Boat Chassis Kit
- Brushed Motors 6V – 12V
- Gearbox (if your motor set came with it)
- Brush ESC for Car/Boat with Reverse function 6V-12V
- Ublox6 GPS
- Bluetooth

ARDUINO IDE

Application Needed

<https://www.arduino.cc/en/main/software>

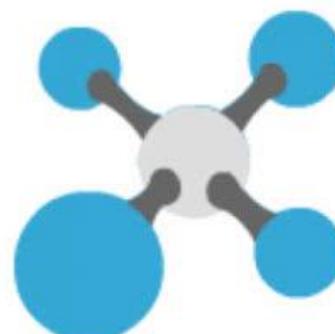

<http://synerflight.com/flywiogui/>

FLYWII GUI & Arduino Drone Multiwii firmware

UBLOX Configuration Platform

<https://www.u-blox.com/en/product/u-center>

<https://www.digi.com/products/embedded-systems/digi-xbee/digi-xbee-tools/xctu>

XCTU Configuration Platform

Tools needed

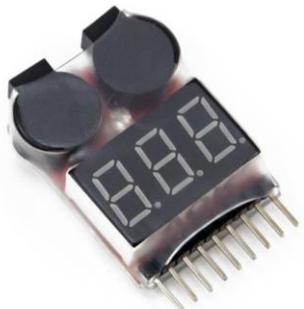

Screwdriver

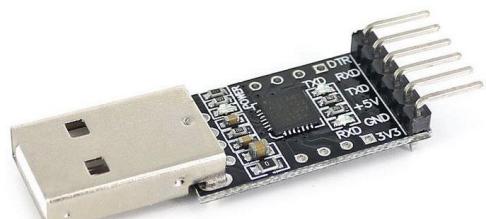

Cutter knife

Soldering Set

Voltage alarm

USB TTL FTDI

Tools needed

Double sided tape

Transparent tape

5A Balance Charger and Battery (3s 1100mah – 1300mah)

Wheel and Geared
motor

Car/Tank 2pcs

Brushed ESCs with
reversing function

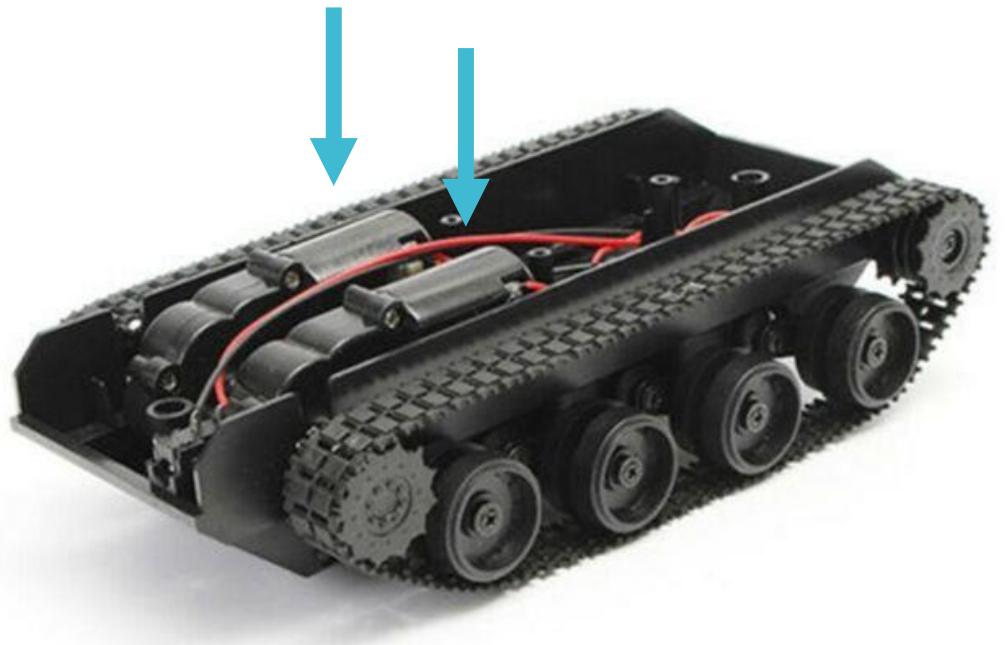

2 Pcs of each

Boat Propeller with
Waterproof motor
Pods

Boat 2pcs

2pcs Motor Differential drive

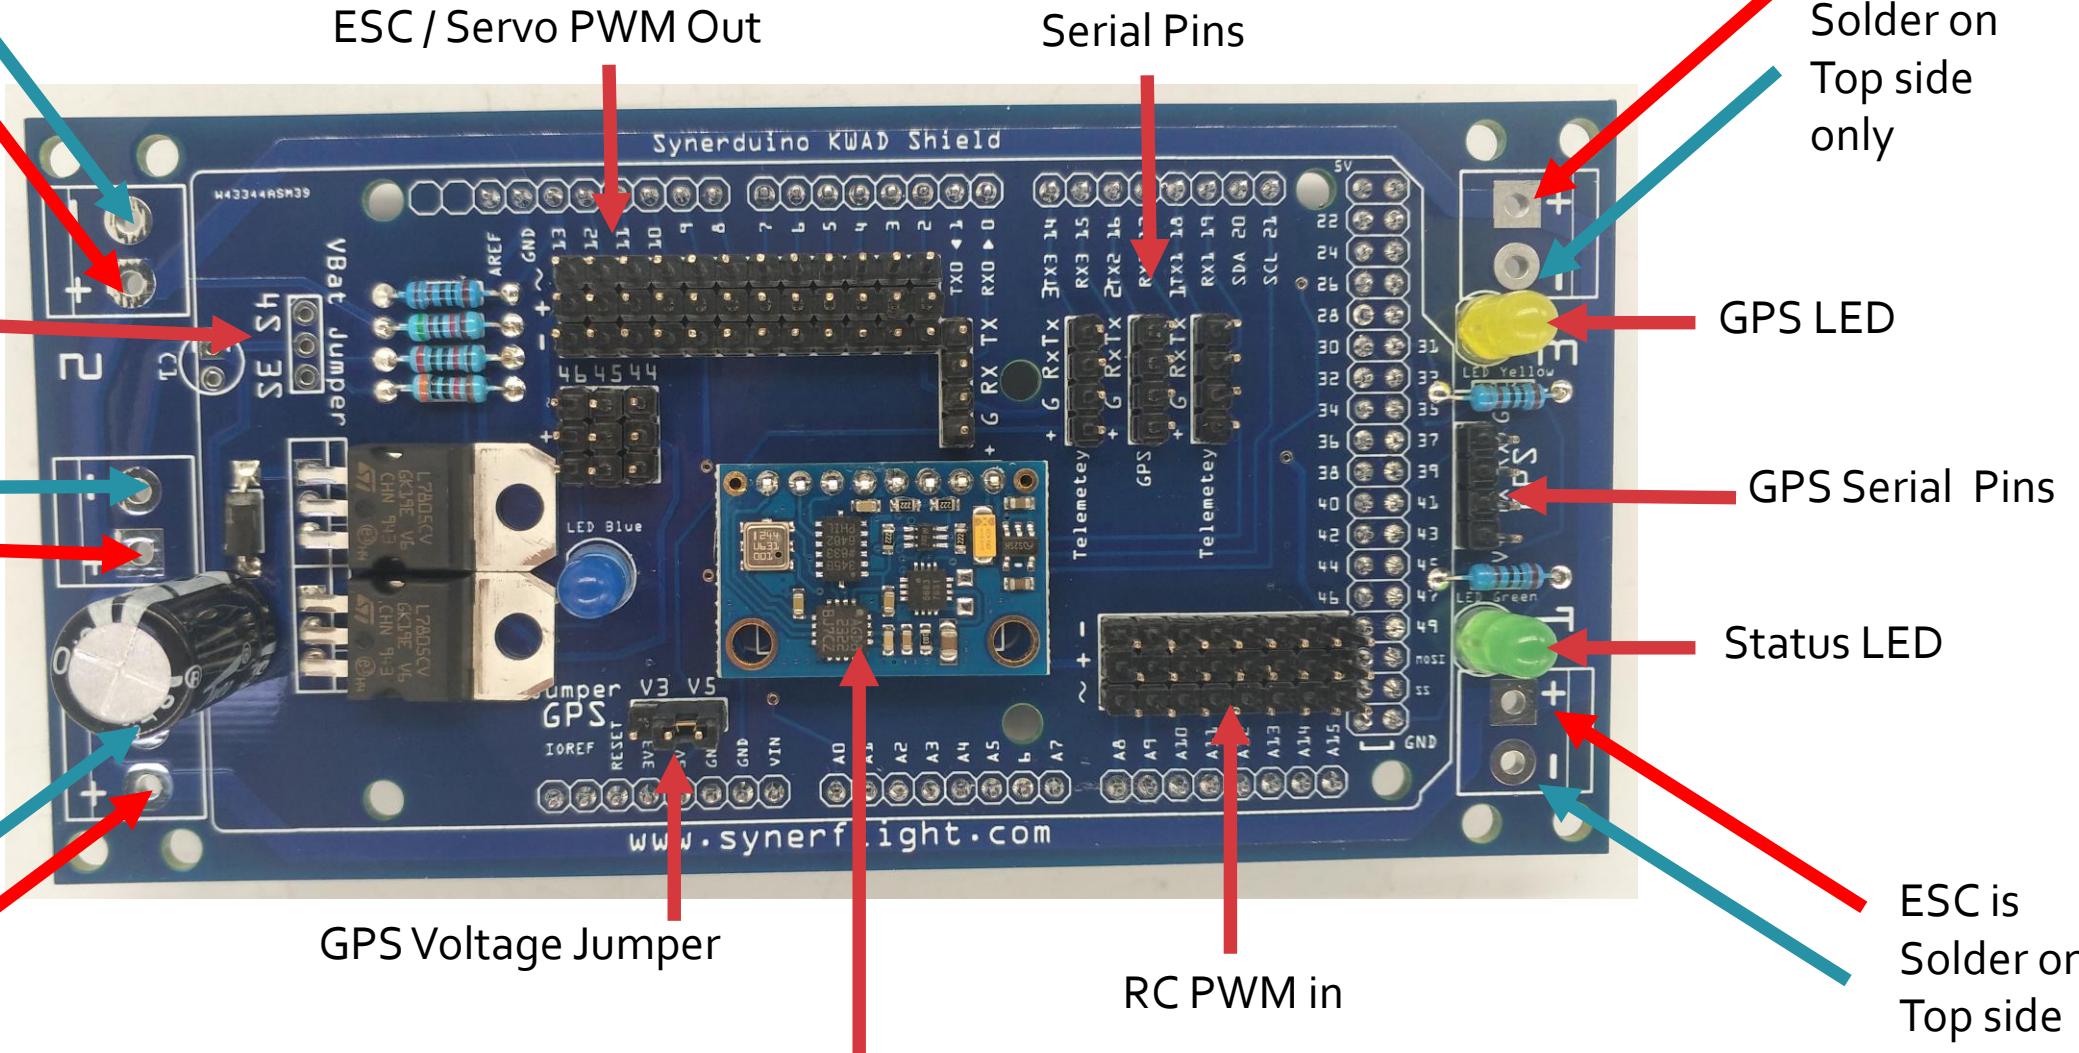

2pcs Motor Differential drive

Synerduino Kwad Shield

ESC is
Solder on
Top side
only

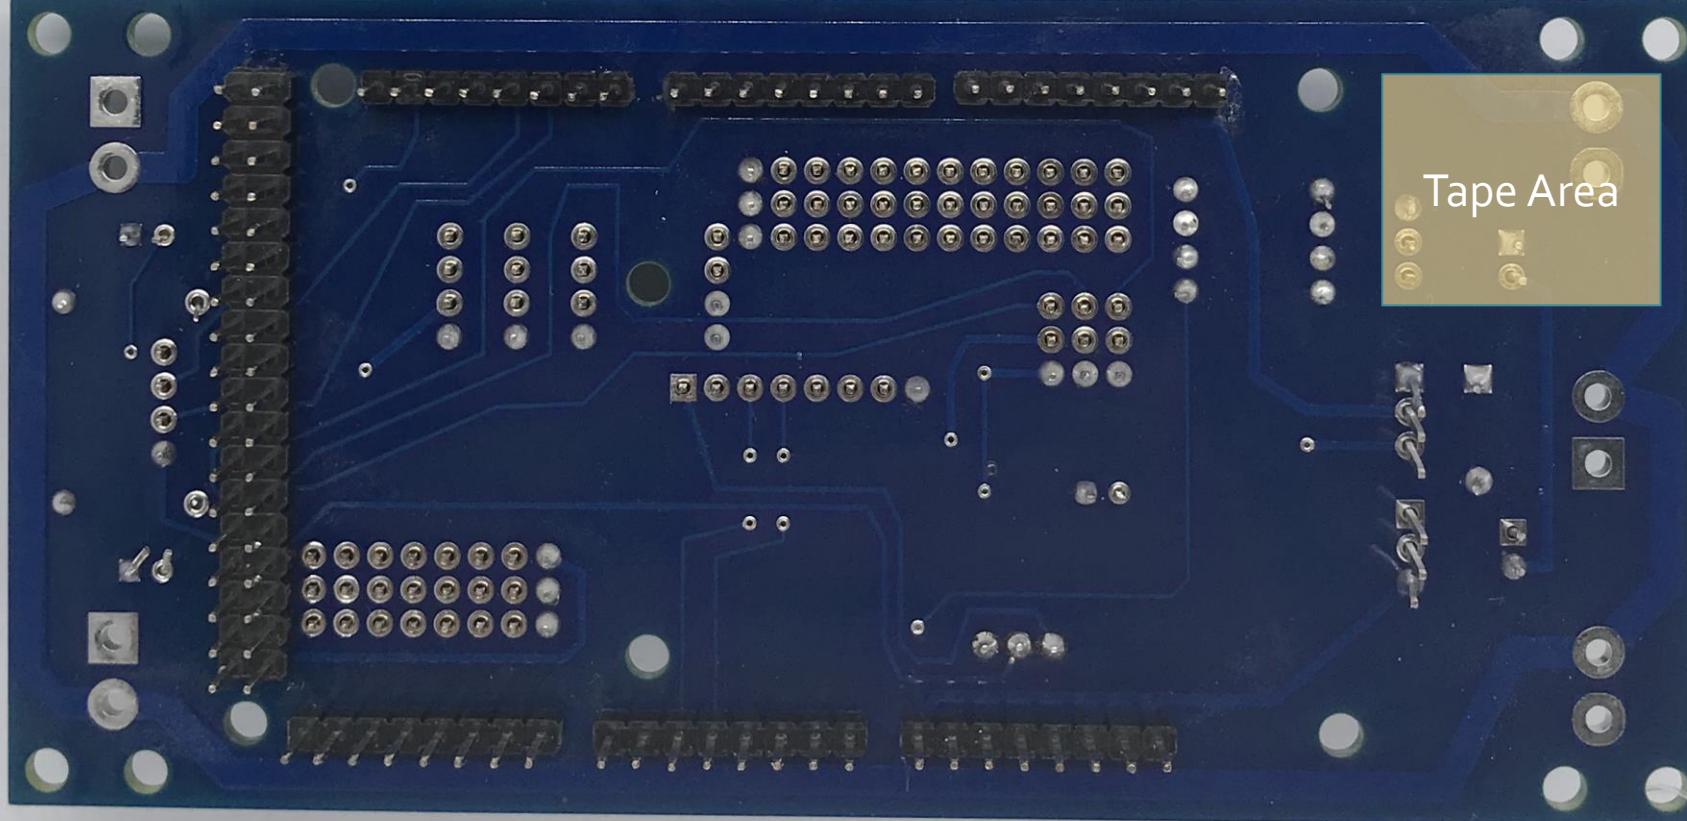

Note : surface mount your solder ESC wire make sure it doesn't penetrate to the bottom of the board

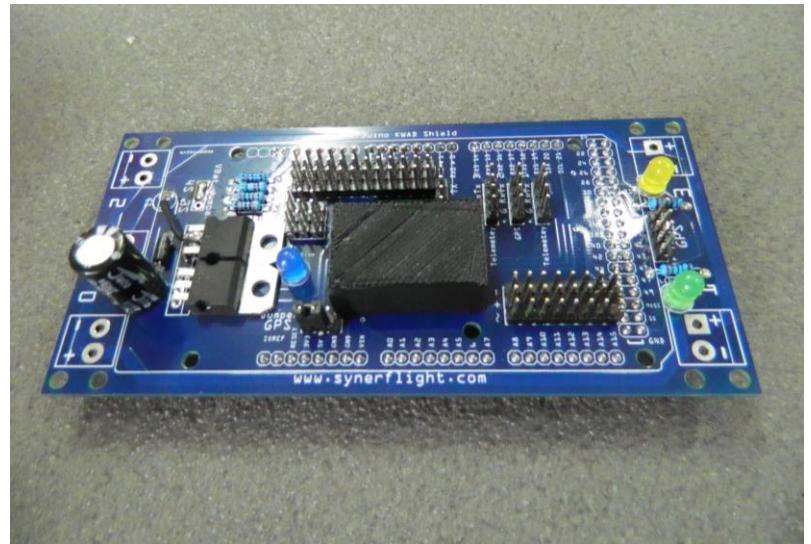

IMU : L3G4200D Gyro / ADXL345 Accelerometer / BMP180 – 85 Baro / MMC5883 Mag

Synerduino Kwad Shield Preparation

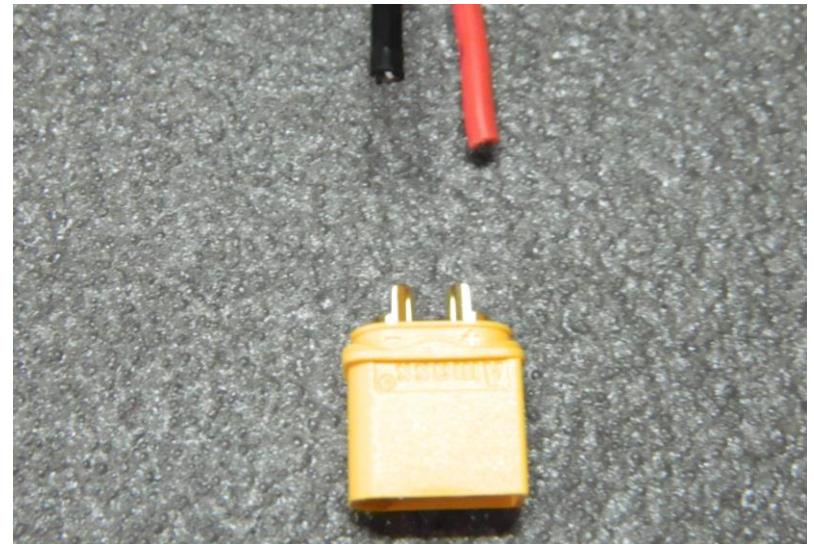

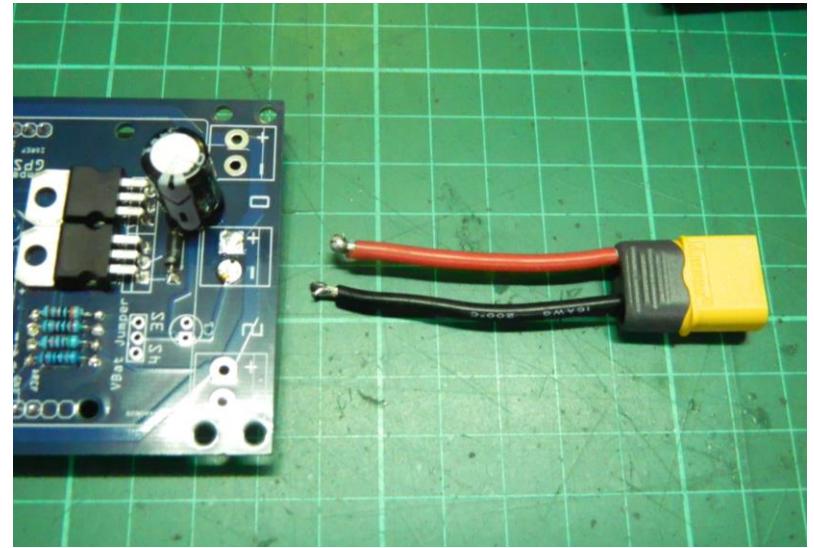

Ensure insulation from the Arduino board add tape on these areas

Use PVA to glue the cover to the IMU sensors seal the rim of the cover all the way

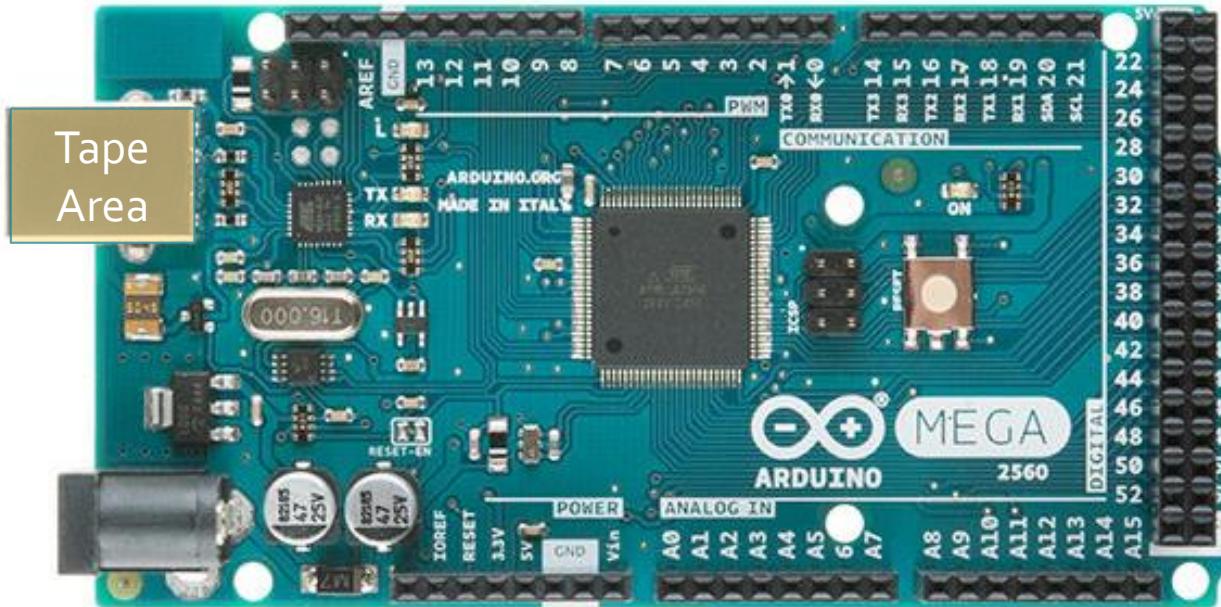

Pls check the polarity of the XT6oPlugs to match up with the board's polarity

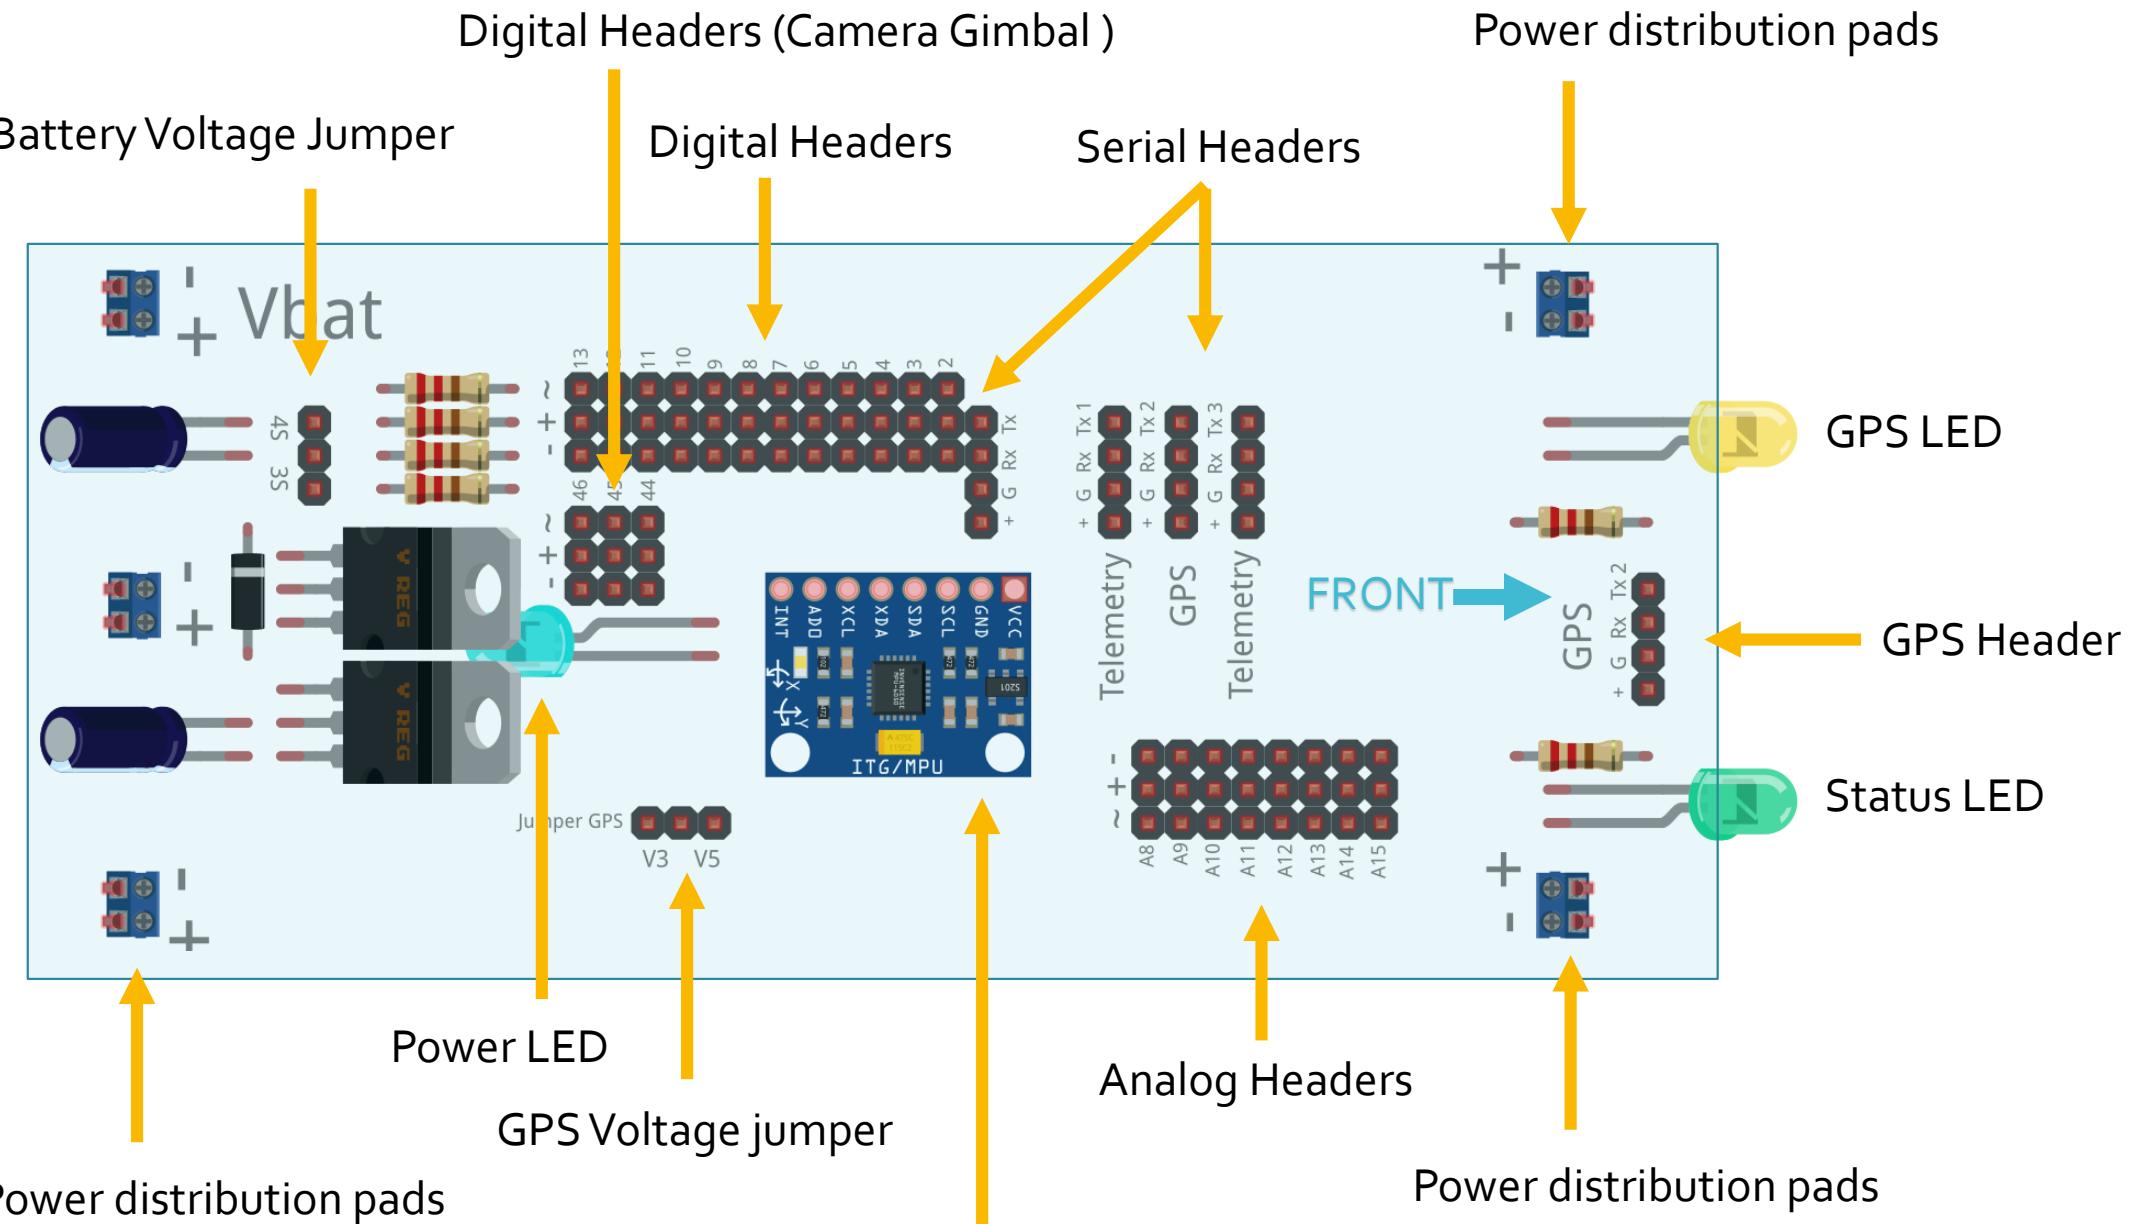

Arduino Board Preparation

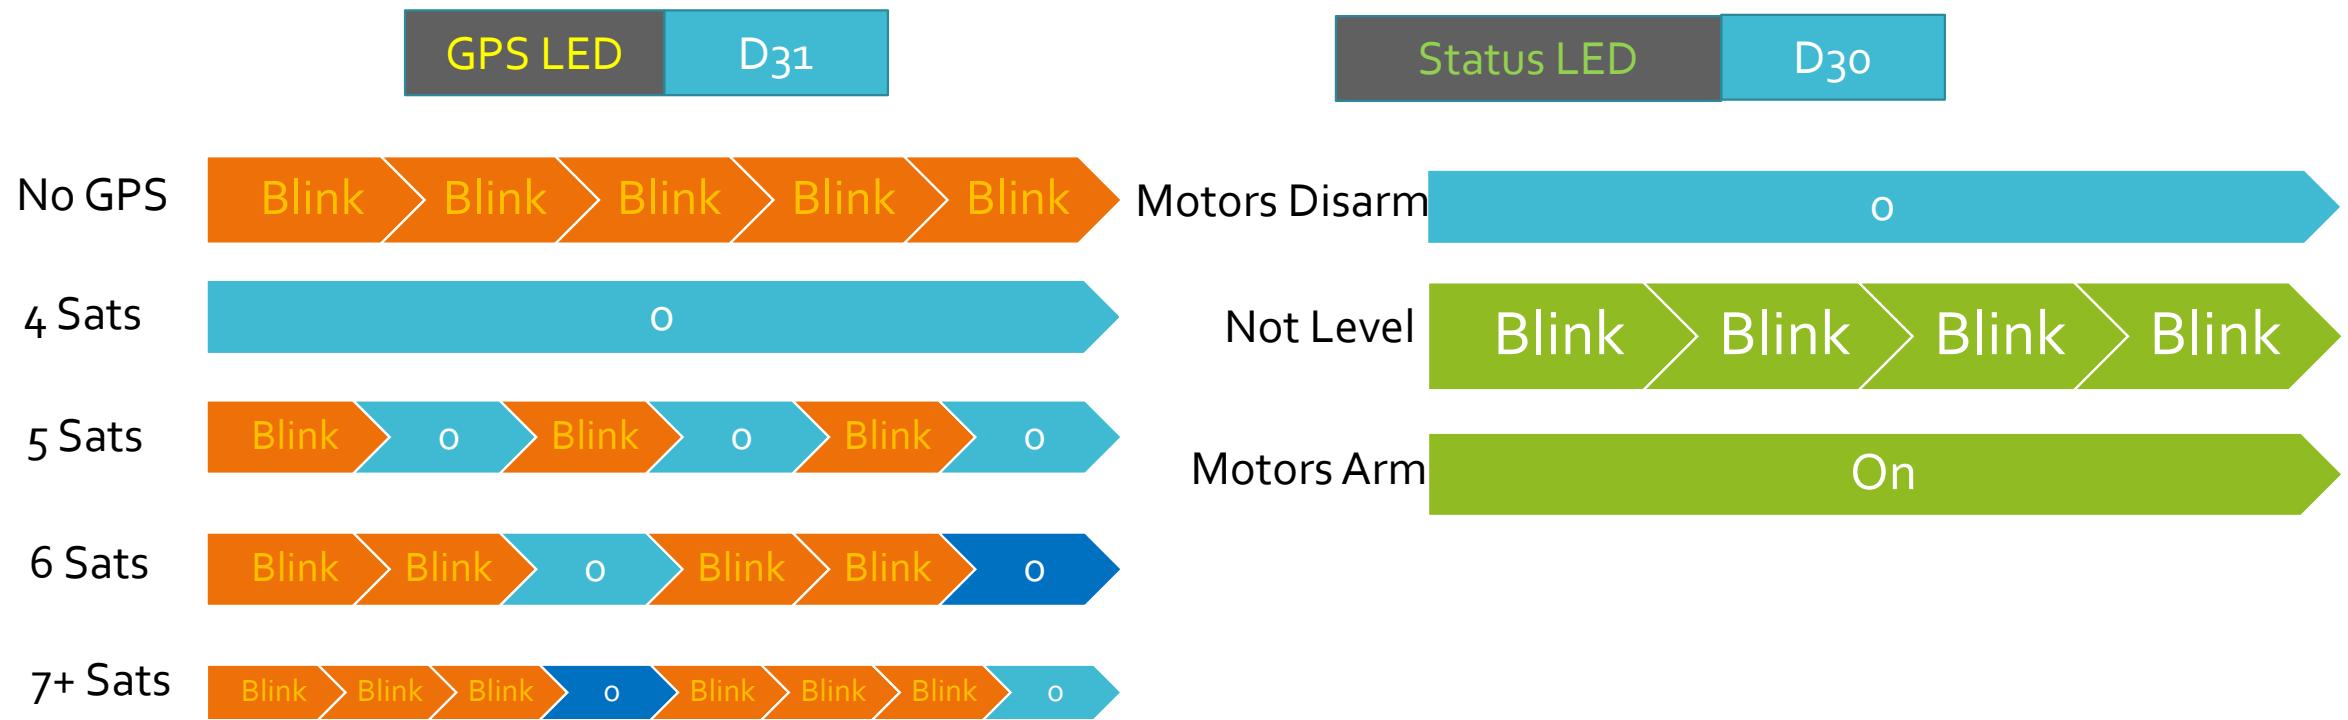

Ensure insulation from the Arduino board add tape on these areas

2560 MEGA

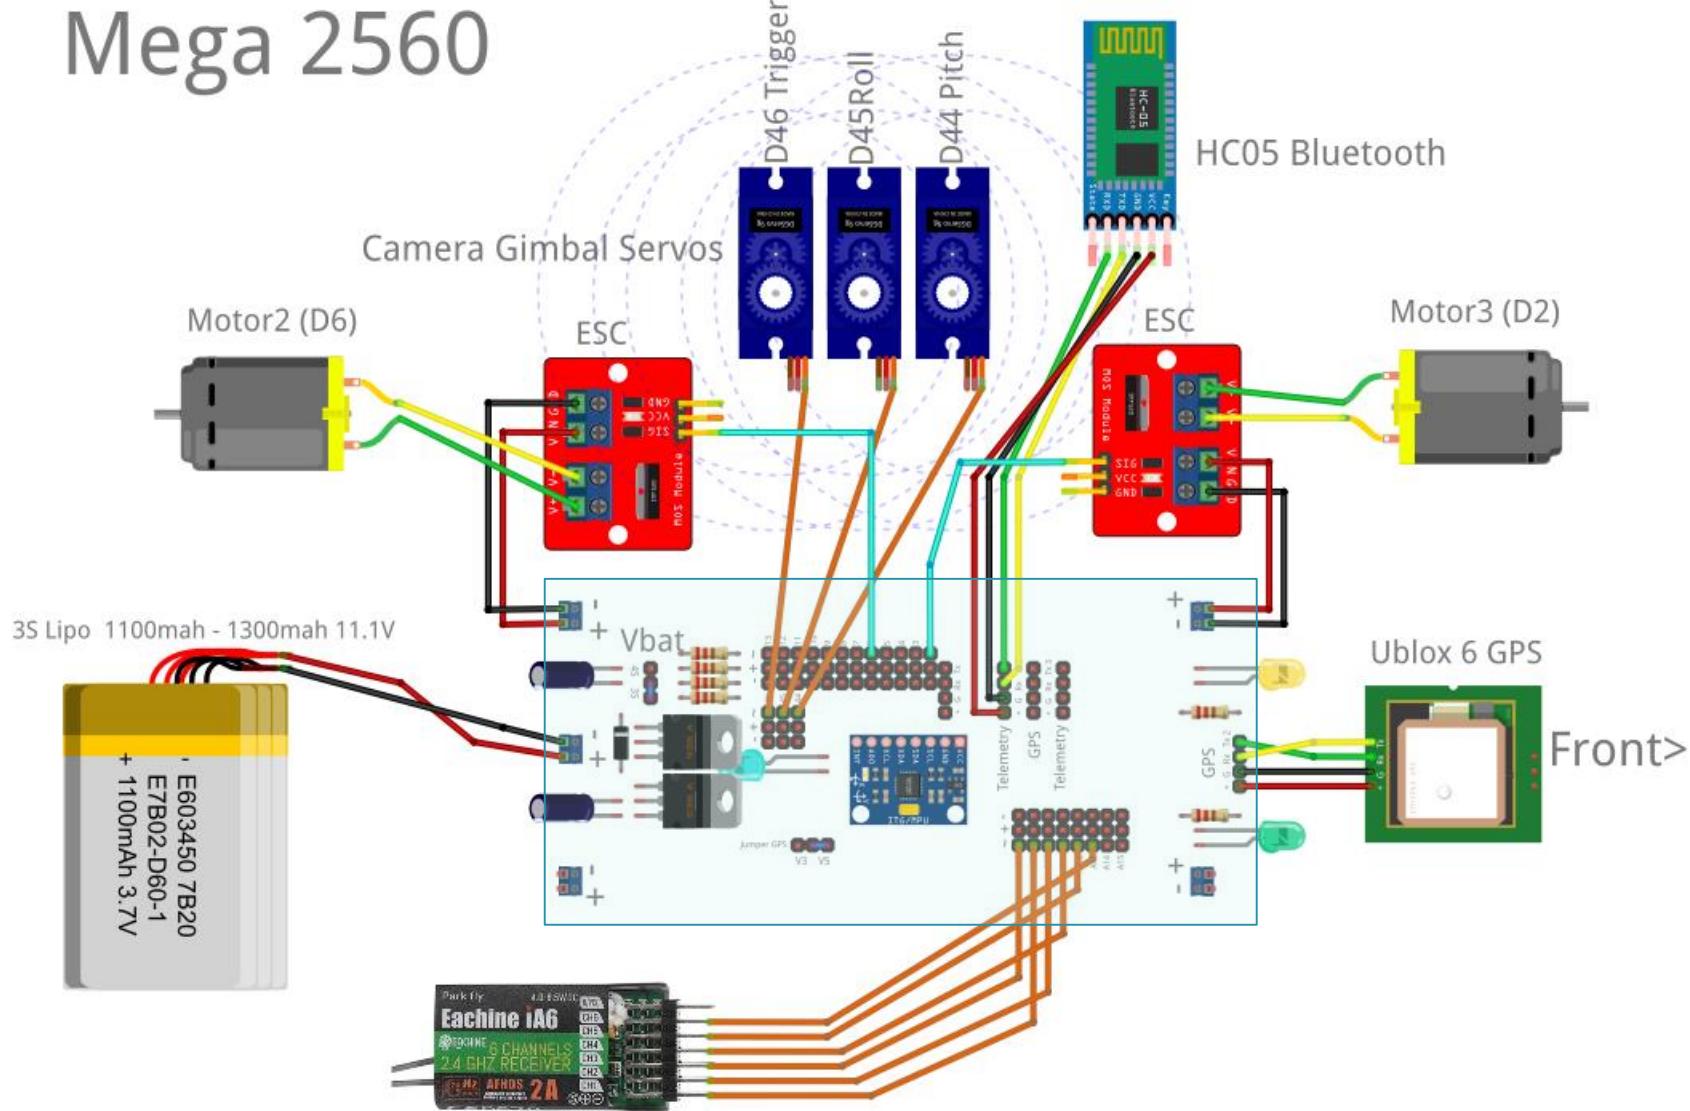

LED Indicator

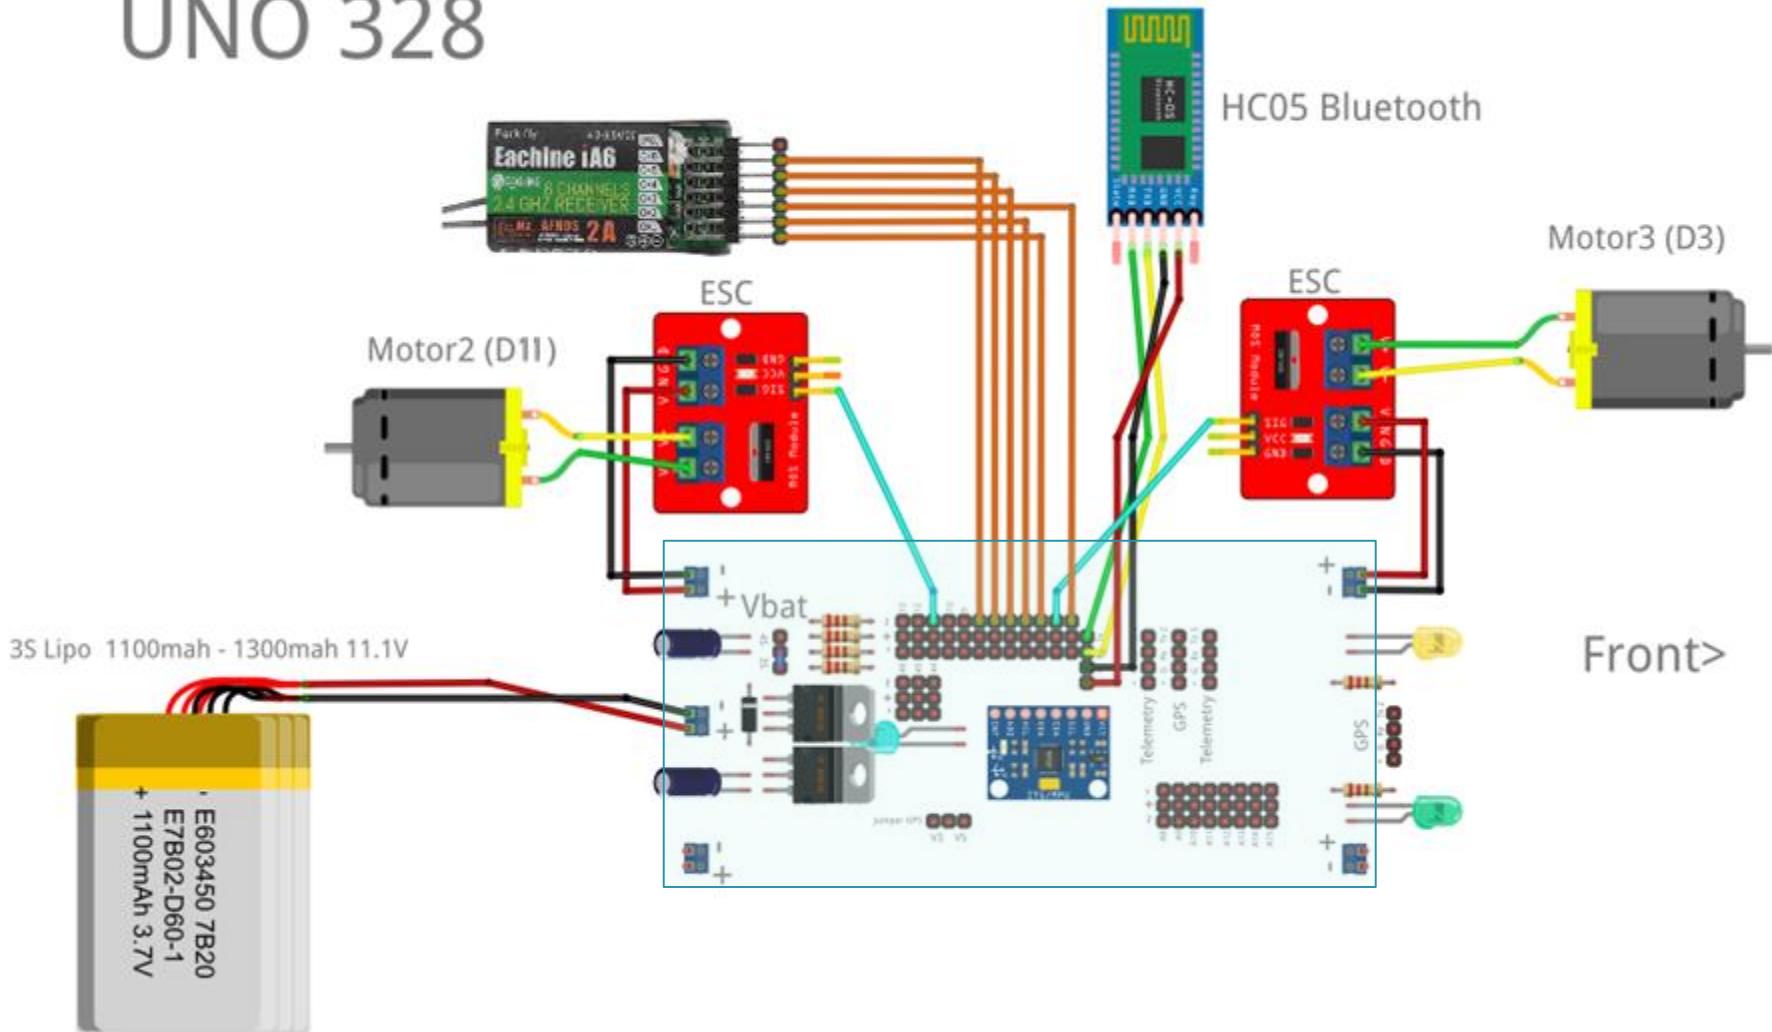

indicate a valid GPS fix by flashing the LED

- led work as sat number indicator
- No GPS FIX -> LED blinks constant speed
- Fix and sat no. below 5 -> LED off
- Fix and sat no. >= 5 -> LED blinks, one blink for 5 sat, two blinks for 6 sat, three for 7 +

Mega 2560

UNO 328

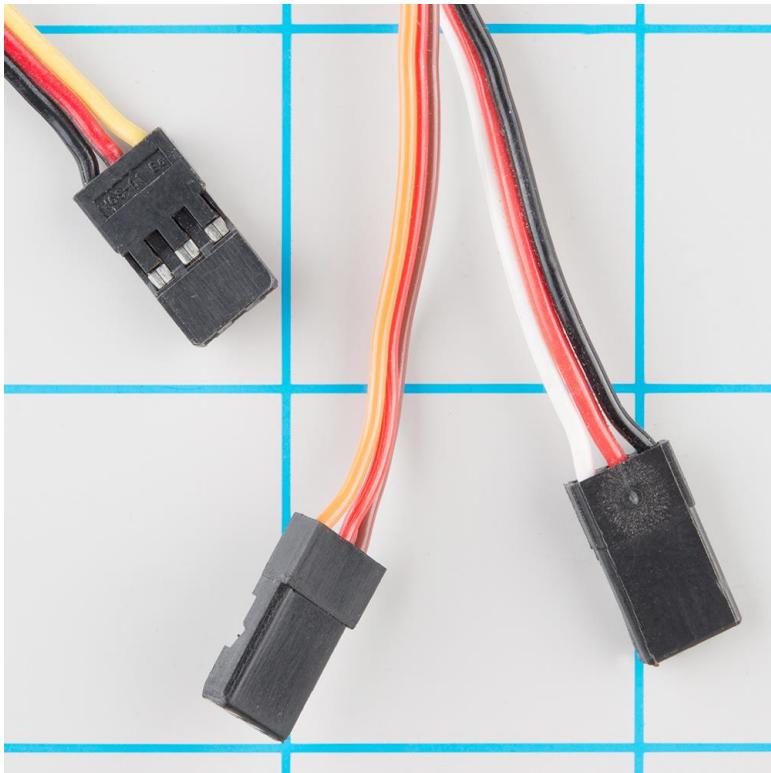

PWM INPUT Assignment

Pls Check the output pin from your Radio Rx manual

RX > Arduino / PWM in	Futaba Format	JR Format	Walkera Format	UNO 328 Input	Mega 2560 Input
Throttle	Ch3	Ch1	Ch3	D2	A8
Aileron	Ch1	Ch2	Ch2	D4	A9
Elevator	Ch2	Ch3	Ch1	D5	A10
Rudder	Ch4	Ch4	Ch4	D6	A11
Aux1	Ch5	Ch5	Ch5	D7	A12
Aux2	Ch6	Ch6	Ch6	D8	A13
Aux3	Ch7	Ch7	Ch7	N/A	A14
Aux4	Ch8	Ch8	Ch8	N/A	A15

SERVO HEADER

~ + -

End view

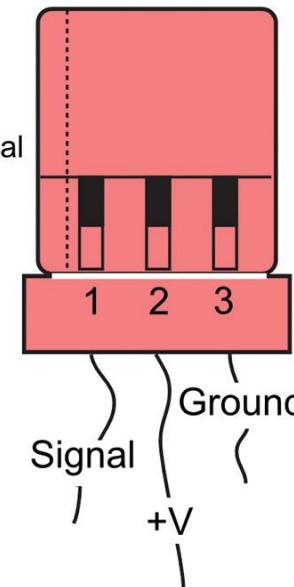

J-type (Futaba)

S-type (Hitec, JR)

Keyway =
signal terminal

They may come with different
coded wire but layout are
always same

OPTO Wires may only have
Signal and Negative Wires o

PWM RECEIVER

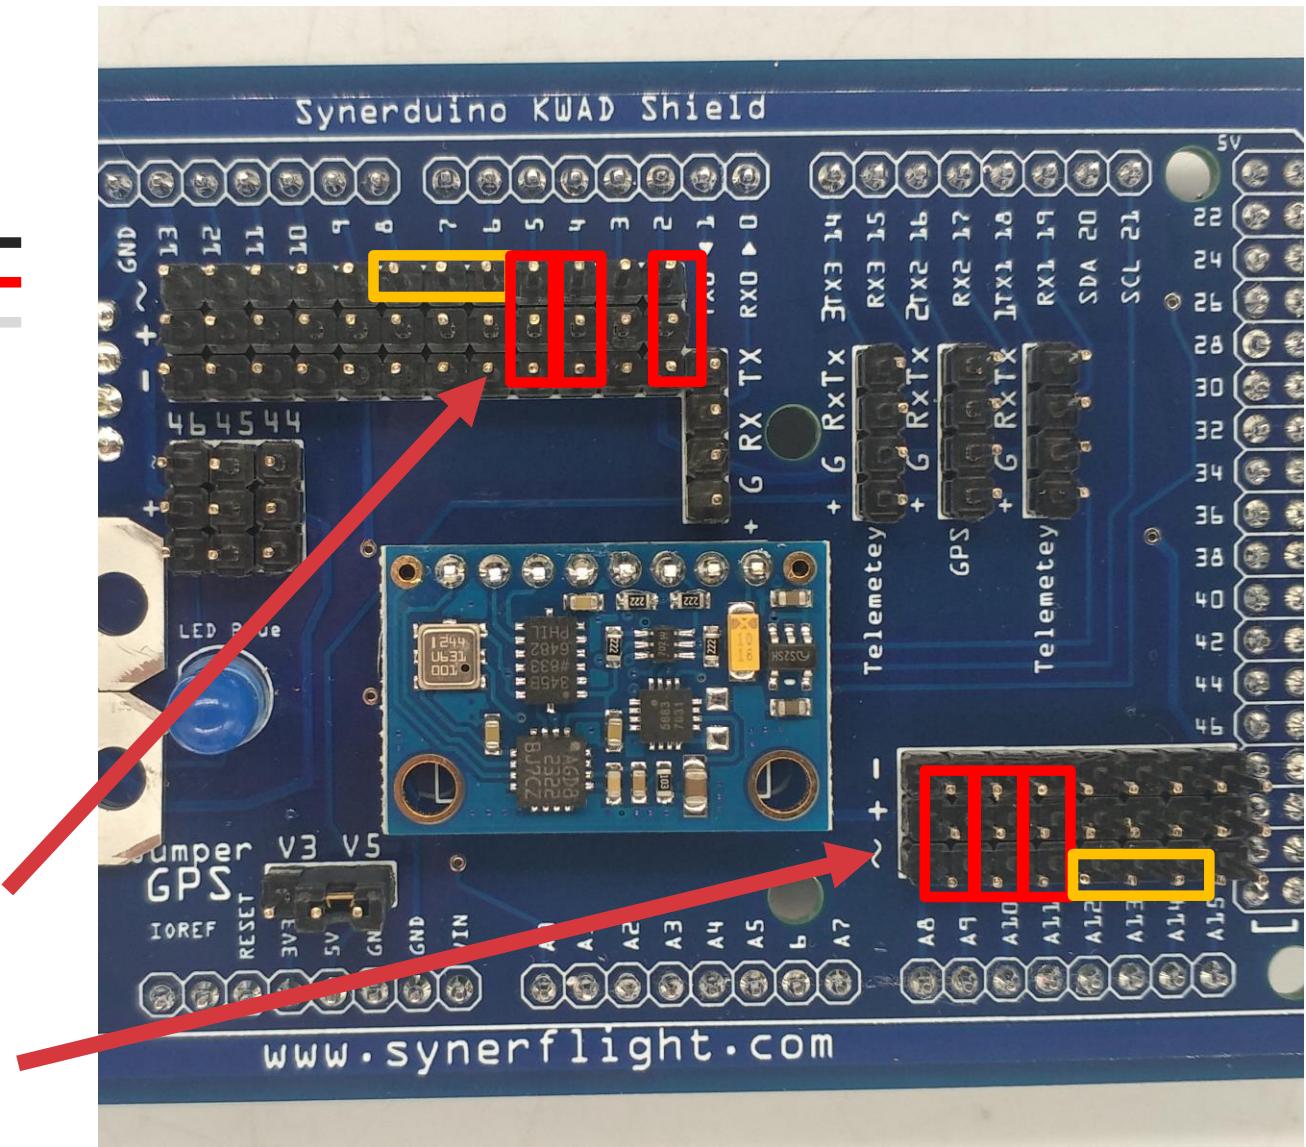

IN CASE YOU'D ASK WHY THE SERVO CONNECTORS WERE DONE THIS WAY , ITS SIMPLY YOU DON'T NEED TO PLUG ALL THE PWM POWER RAILS ON ALL CHANNELS YOU JUST NEED THE PWM SIGNAL PIN ALONE

MOSTLY RUDDER AUX1 AND AUX2

UNO PWM IN

MEGA PWM IN

Config.h

Uncomment #Define Bi

This puts the vehicle into
Bicopter or surface vehicle mode

The screenshot shows the Arduino IDE interface with the file `MultiWii - config.h` open. The code defines various vehicle types and sets a minimum throttle value. The `#define BI` line is highlighted.

SERIAL COM

SERIAL BAUD RATE

WILL DEPEND ON WHAT BAUD YOUR TELEMETRY MODULE ARE SET INTO YOU CAN CHANGE IT TO SUITE THE PORT YOUR DEVICE IS CONNECTED TO.

SERIAL 0 CAN BE USE FOR TELEMETRY GIVEN NOTHING IS CONNECTED TO THE USB AT THIS POINT. AND FIRMWARE MUST BE FLUSH PRIOR TO HOOKING UP ANYTHING TO THIS PINS

SERIAL 1, 3 IS RESERVE FOR TELEMETRY

115200 FOR BLUETOOTH HC-05

38400 FOR XBEE RADIO

57600 for SIK RADIO

SERIAL 2 IS RESERVE FOR GPS

NMEA Baud 57600

#define SERIAL2_COM_SPEED 115200
#define SERIAL3_COM_SPEED 115200

/* when there is an error on I2C bus, we neutralize the values during a short time. expressed in microseconds
it is relevant only for a conf with at least a WMP */
#define NEUTRALIZE_DELAY 100000

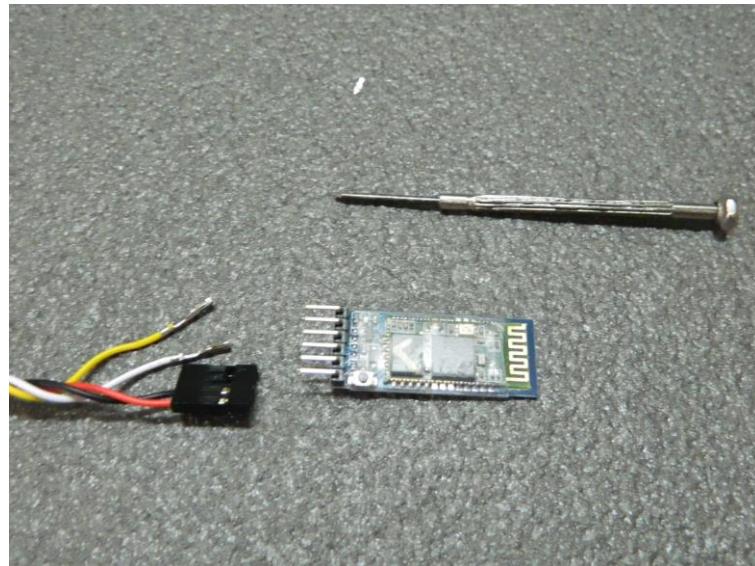

***** Gyro filters *****
/* Lowpass filter for some gyros */
/* ITG3200 & ITG3205 Low pass filter setting. In case you cannot eliminate all vibrations to the Gyro, you can try
to decrease the LPF frequency, only one step per try. As soon as twitching gone, stick with that setting.
It will not help on feedback wobbles, so change only when copter is randomly twitching and all dampening and
balancing options ran out. Uncomment only one option!
IMPORTANT! Change low pass filter setting changes PID behaviour, so retune your PID's after changing LPF.

GPS

U BLOX NEO 6

PLUG IN TO SERIAL TX 2 RX 2 ON THE DRONE SHIELD BOARD

ATTENTION:

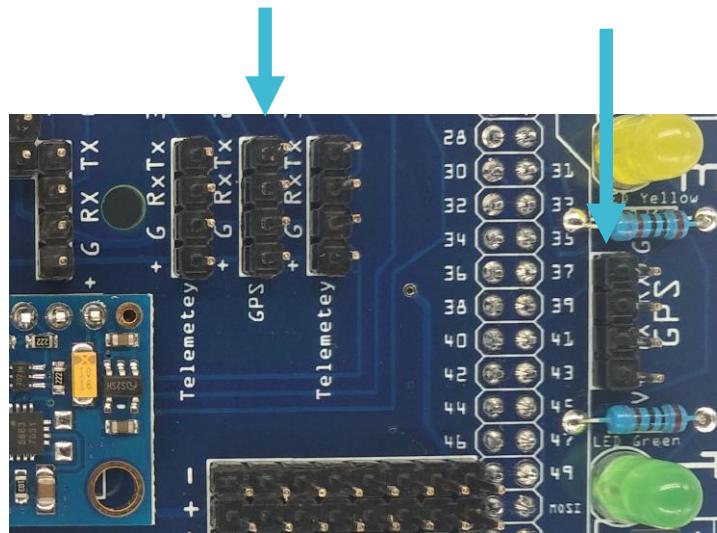

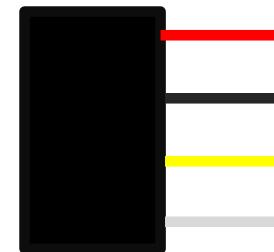

YOU MAY NEED TO REARRANGE THE HEADERS TO CONNECT THE GPS MODULE TO THE SHIELD BOARD ACCORDINGLY

VCC >> +

GND >> G

TX >> RX

RX >> TX

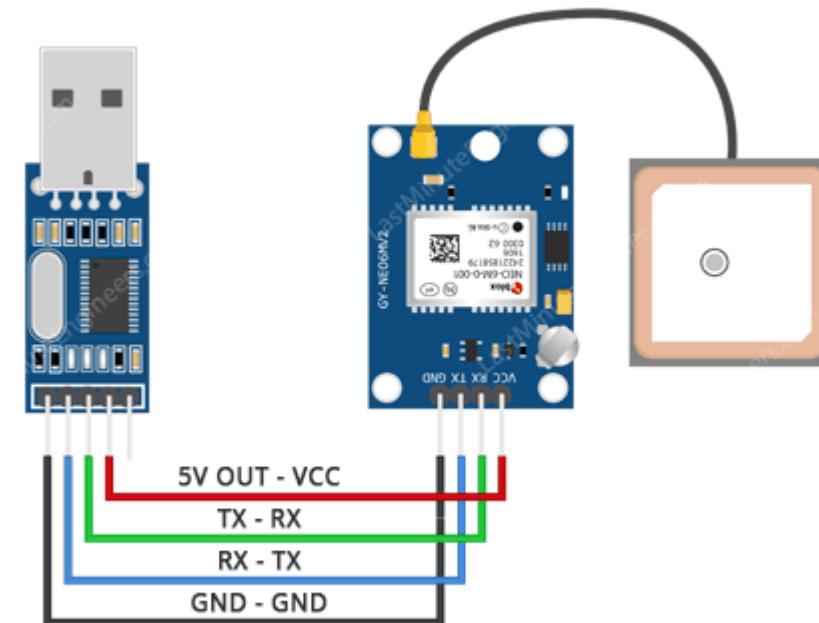

SEE TO IT THE WIRES COLOR CODE MATCHES THE MARKINGS

IMPROPER INSTALLATION MAY CAUSE DAMAGE TO THE ARDUINO BOARD AND SHIELD DUE TO REVERSE POLARITY

NOTE: YOU MAY NEED TO RE-SECURE THE GPS ANTENNA PATCH AGAIN WITH DOUBLE SIDED TAPE WHEN NECESSARY AS THE MODULE CAME IN WITH A TEMPORARY TAPE

NOTE: WE PRESET THE GPS FOR YOUR CONVENIENCE TO THE PROPER SETUP BUT SHOULD YOU WISH TO CHANGE THE SETTING ON YOUR DIGRESSION

GPS CONFIGURING

U BLOX NEO 6

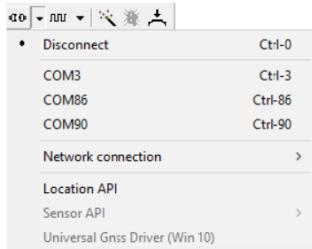

PLUG IN TO SERIAL TX 2 RX 2

USB TTL TO PROGRAM THE GPS

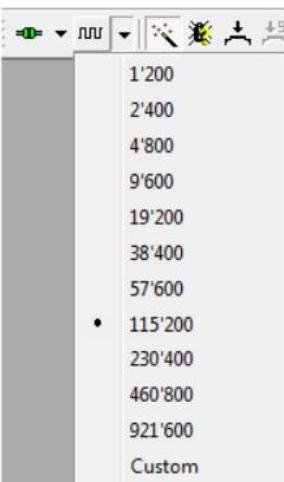

THIS GOES SAME ON THE DRONE SHIELD

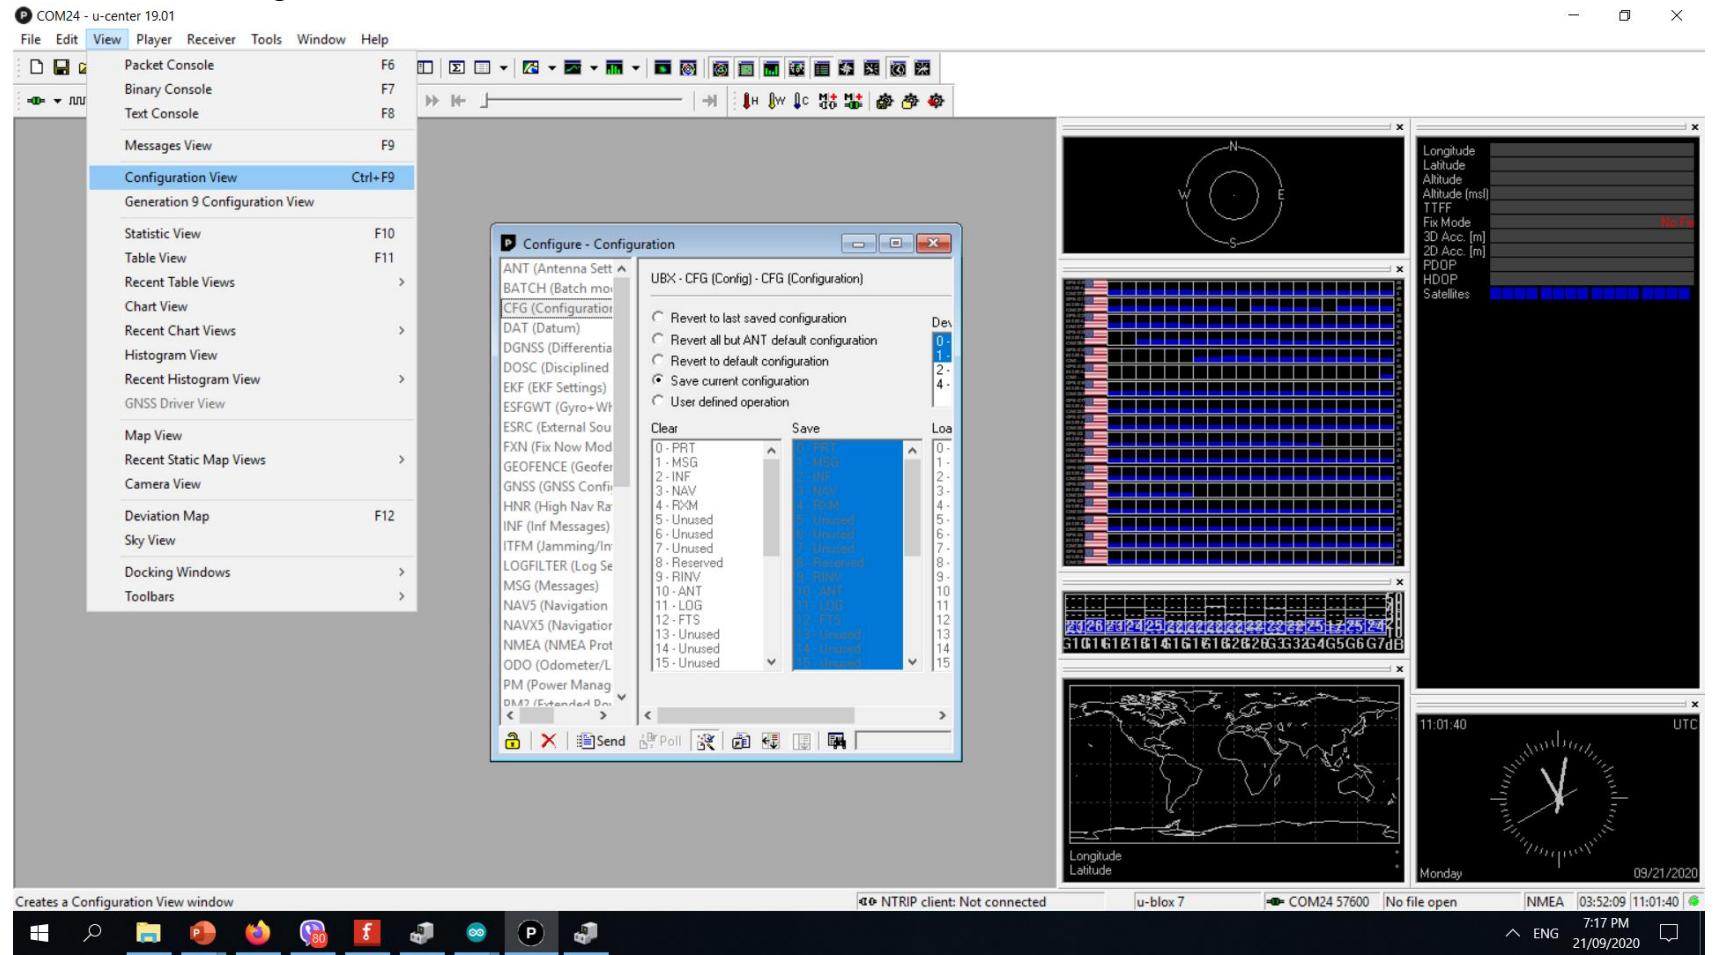

Connect to the device. Select the COM port your GPS and USBTTL is connected to

Connect to the baud rate your GPS is set to Default (9600) Setup we wanted (57600)

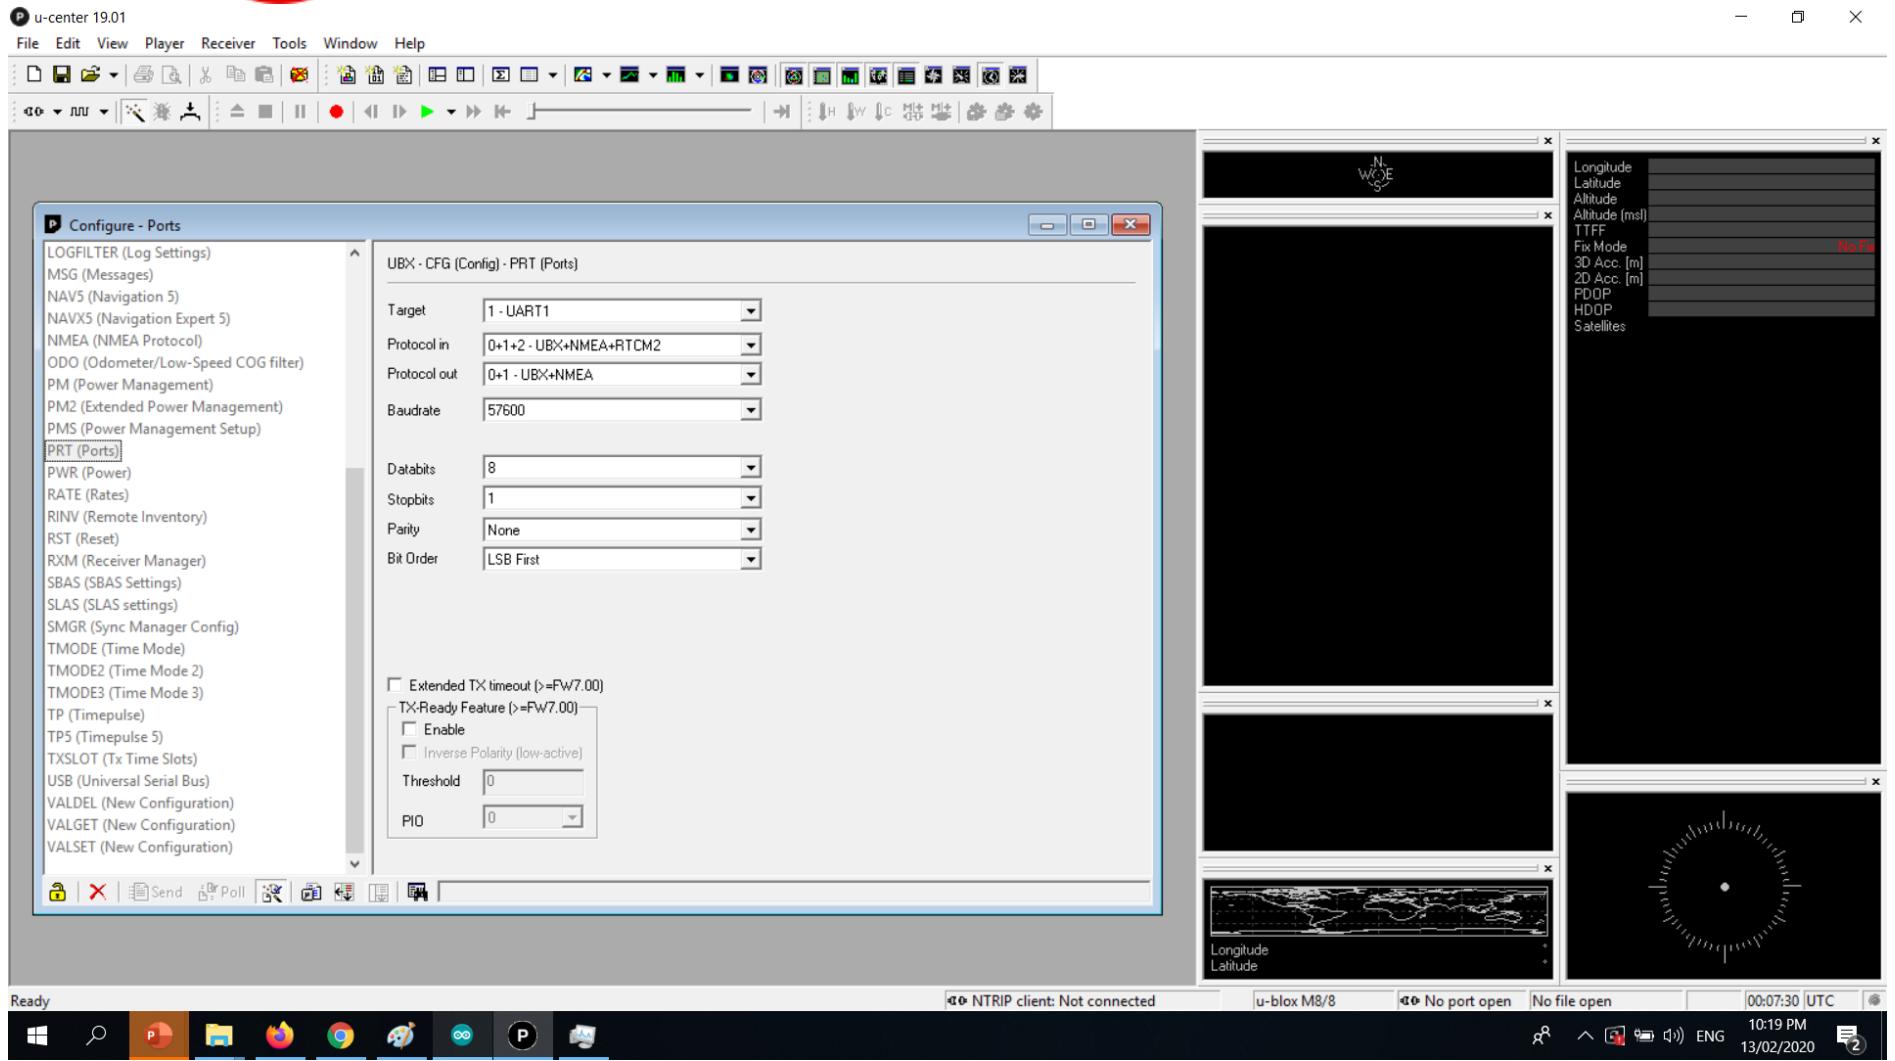

Go to View> Configuration View

1. Connect to the device.
2. Open View / Messages View
3. Select UBX-CFG-PRT.
4. Poll the current configuration from the receiver
Change the setting to the desired baud rate. (57600)
5. Send the message to the receiver

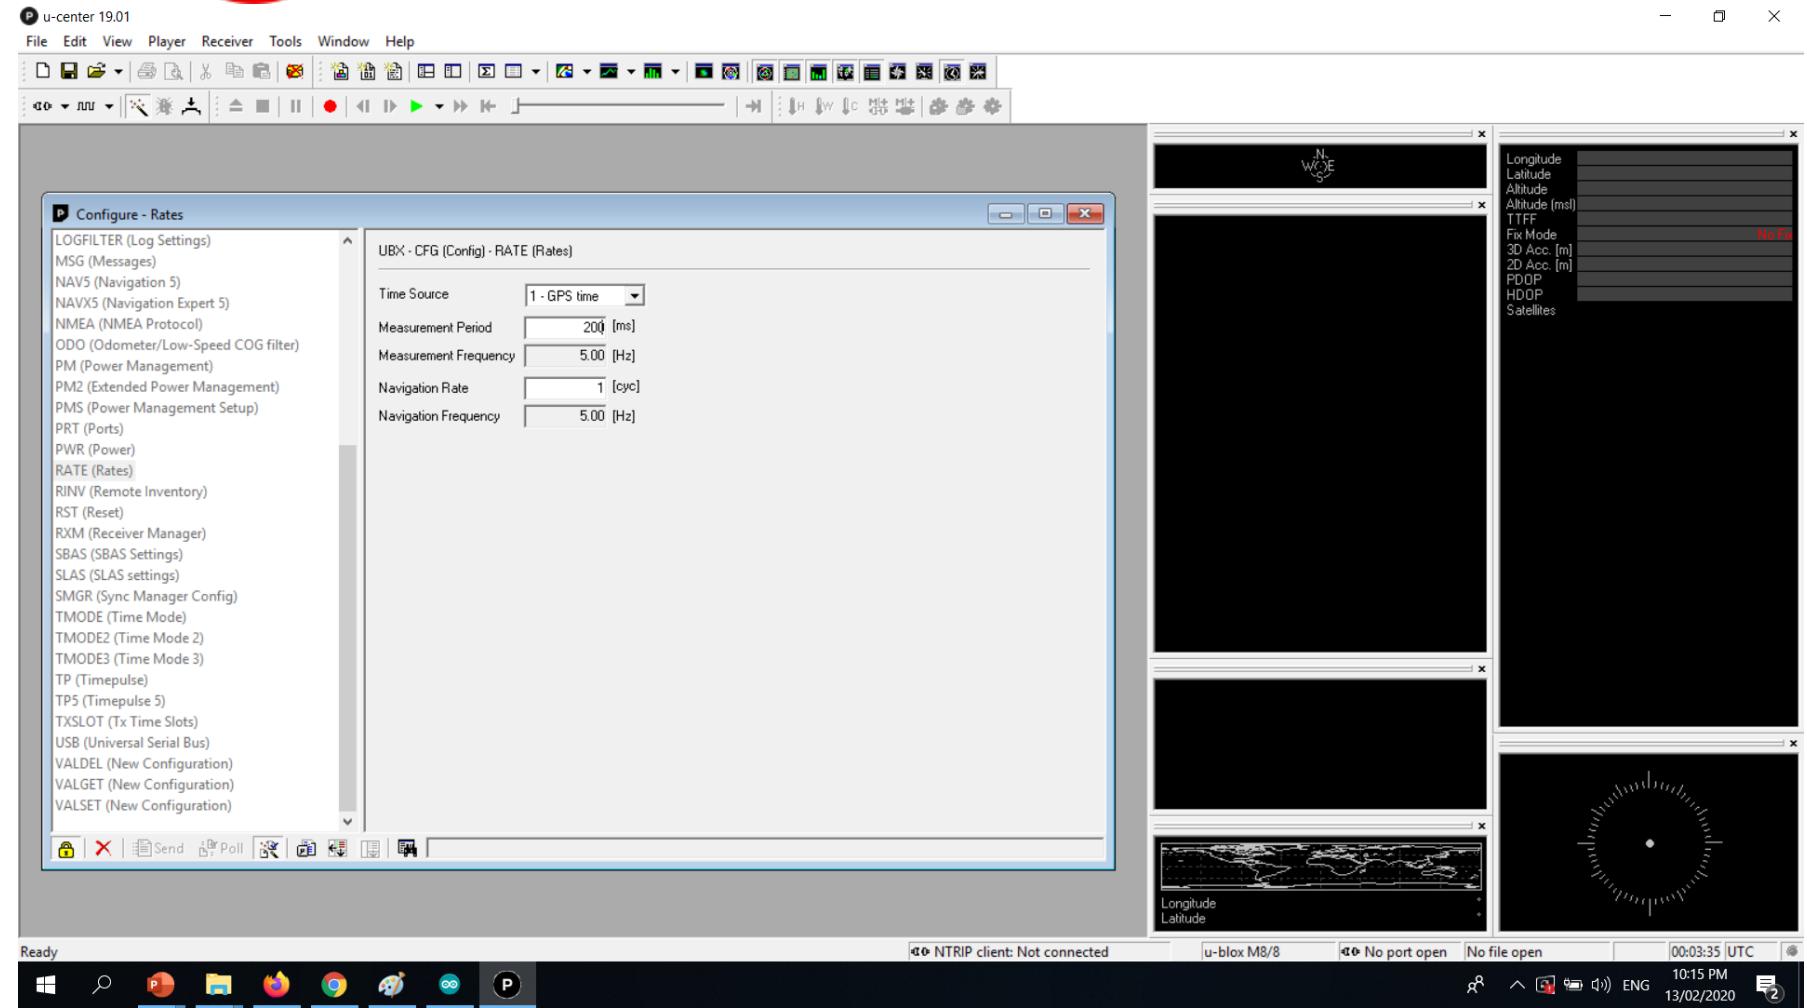

Rate zooms
Frequency 5hz

Note after updating
the settings and
hitting the send
button below

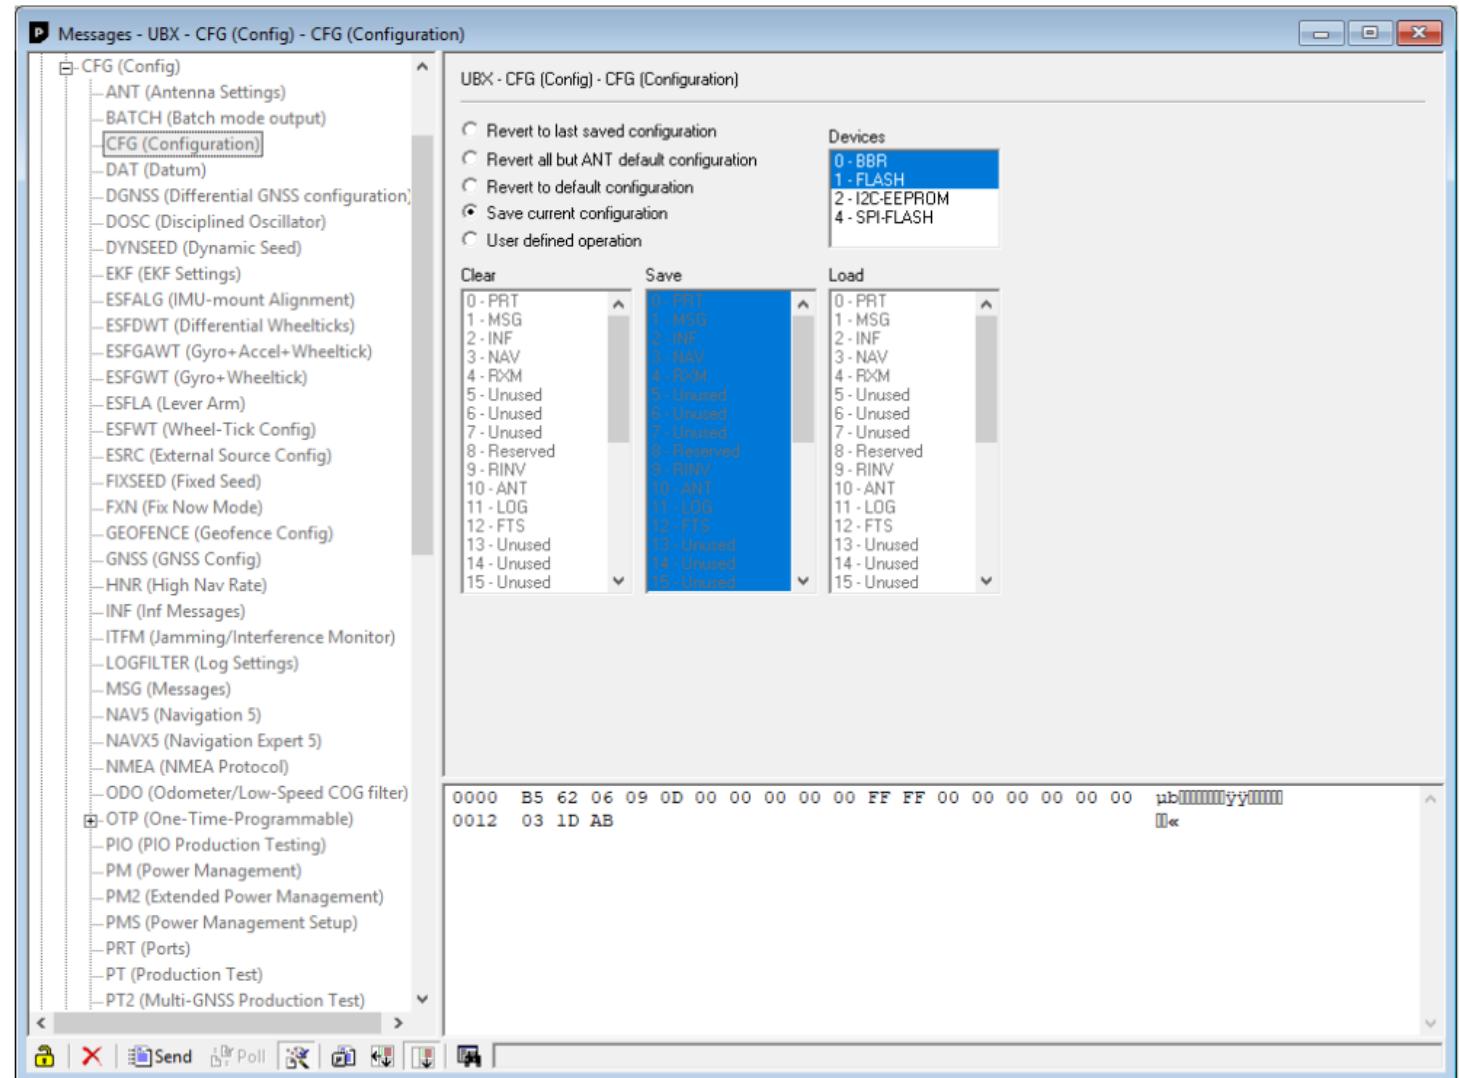

Exit the
configuration
window this will
prompt you to the
save parameters .
Hit “Yes”

U CENTER

1. Connect to the device.
2. Open View / Messages View
3. Select UBX-CFG-CFG.
4. Select “save current configuration”
5. Send the message to the receiver hit the Lock icon then send icon in the bottom

**Disconnect /
Reconnect to the GPS
again using the 57600
baud to see if the
parameters are save**

Note: motors will spool up to Idle Speed

**DEDICATED USER INTERFACE
AS CONFIGURATOR AND
GROUND STATION FOR THE
ARDUINO DRONE**

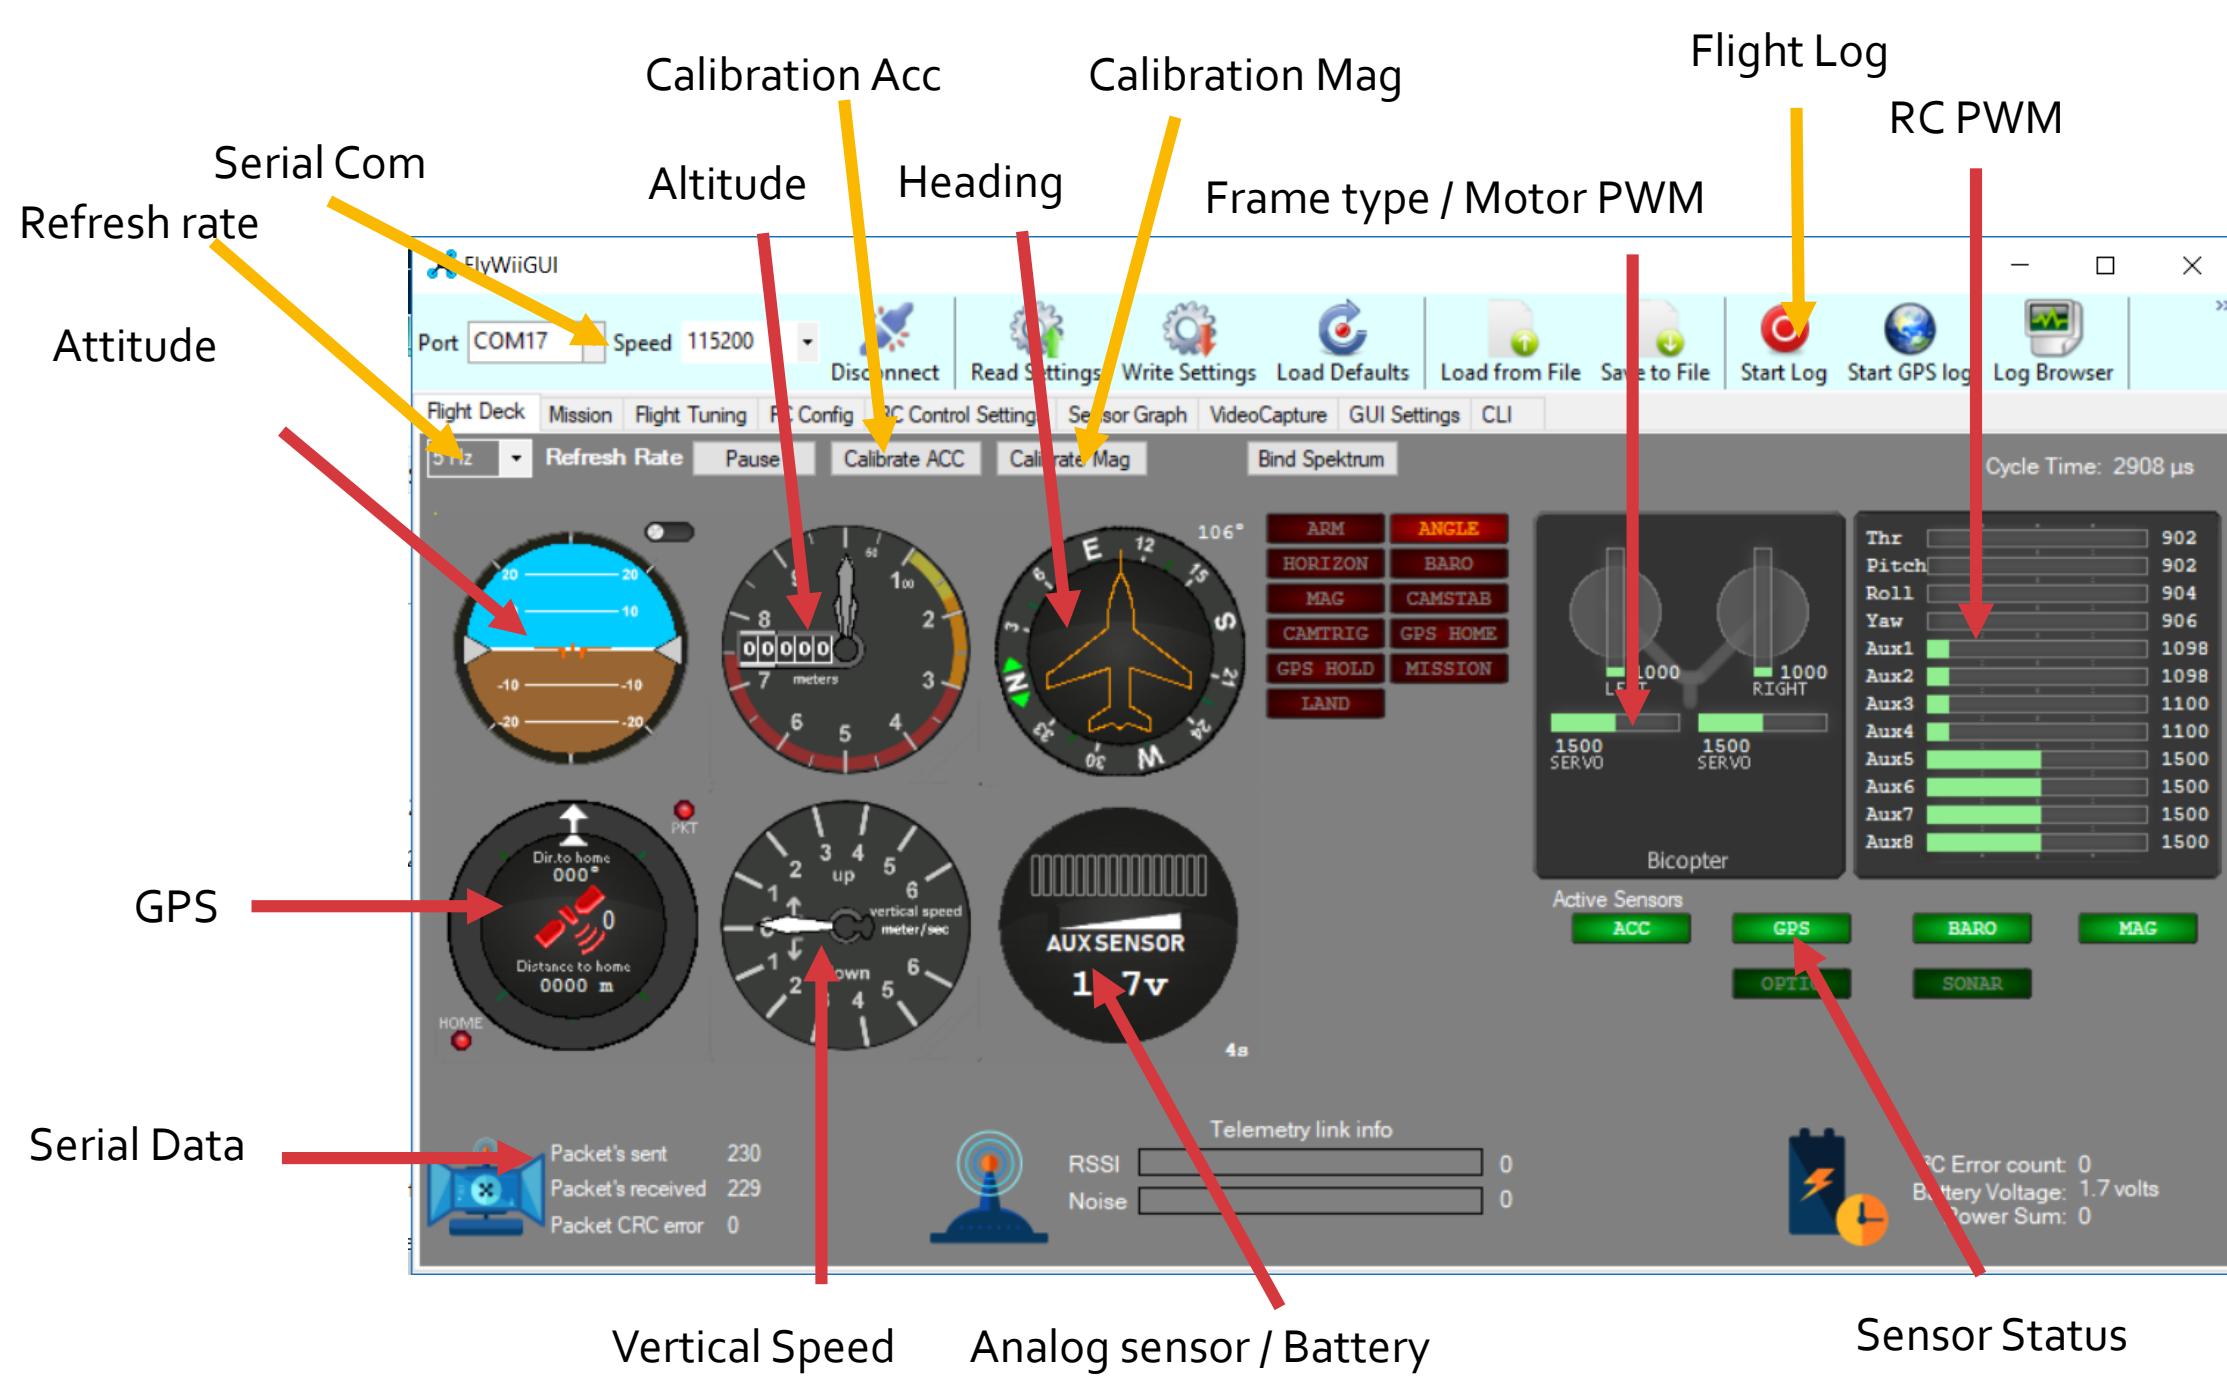

FLYWII GUI

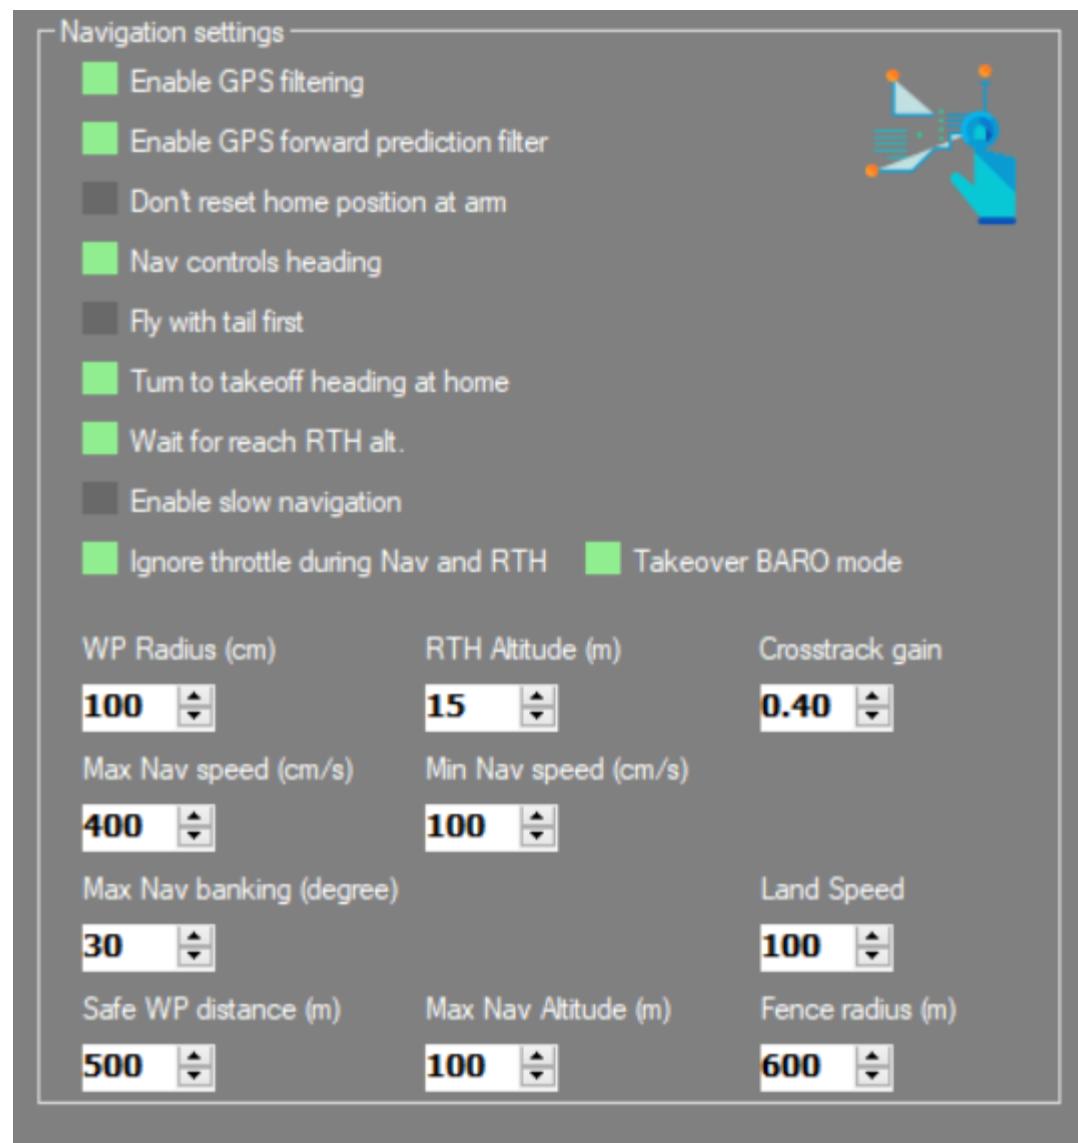

This screenshot shows the FlyWiiGUI configuration interface. It features a toolbar with buttons for Connect, Read Settings, Write Settings, Load Defaults, Load from File, Save to File, Start Log, Start GPS log, Log Browser, and About. The main area is divided into sections for Flight Deck, Mission, Flight Tuning, FC Config, RC Control Settings, Sensor Graph, VideoCapture, GUI Settings, and CLI. The Flight Tuning section contains numerous sliders and dropdowns for roll, pitch, yaw, and altitude PID gains, as well as rates and expo values. To the right, there's a sidebar for Navigation settings with checkboxes for GPS filtering, forward prediction, and various navigation modes. At the bottom, there are fields for WP Radius (cm), RTH Altitude (m), Crosstrack gain, Max Nav speed (cm/s), Min Nav speed (cm/s), Max Nav banking (degree), Land Speed, Safe WP distance (m), Max Nav Altitude (m), and Fence radius (m), each with numerical inputs.

For our Arduino Drone we
provide the FlywiiGUI just for this
<http://synerflight.com/flywiogui/>

Other Navigation Functions

WP Radius – the radius of the area the Pos PID will trigger if it has reached the waypoint

Max Nav Speed – Maximum speed the vehicle travels between waypoints (too fast and you likely over shoot your target) **for first mission flight test Nav speed of 100cm/s with ("Enable Slow Navigation "Active)**

Min Nav Speed – the speed the drone travels when within the WP Radius

RTH Altitude – Altitude the drone will climb to when it's below the altitude in relation to its home point when the RTH is triggered set this to 0 to RTH at current altitude

Max Nav Banking – the maximum allowable pitch and roll the drone will be set to while traveling between waypoints (tune this along with Max Nav Speed to take account with Environment conditions)

Max Nav Altitude – Max altitude the drone is capped to fly at

Land Speed – speed of descending for landing cm/s

Safe WP Distance – max distance between waypoints before it nulls out

Fence Radius – Geo Fence to keep the drone within the perimeter in relation to home position

CrossTrack gain - tune the GPS and Nav sensitivity

GPS Filtering – used to enhance GPS accuracy

GPS Forward Prediction Filter – predicting the vehicle's location and to compensate for lag. (optional) – not necessary for most applications

Navigation settings –

- Enable GPS filtering
- Enable GPS forward prediction filter
- Don't reset home position at arm
- Nav controls heading
- Fly with tail first
- Turn to takeoff heading at home
- Wait for reach RTH alt.
- Enable slow navigation
- Ignore throttle during Nav and RTH Takeover BARO mode

WP Radius (cm)	RTH Altitude (m)	Crosstrack gain
100	15	0.40
Max Nav speed (cm/s)	Min Nav speed (cm/s)	
400	100	
Max Nav banking (degree)	Land Speed	
30	100	
Safe WP distance (m)	Max Nav Altitude (m)	Fence radius (m)
500	100	600

Don't Reset Home position at Arm – this retains the home position where you first plug power on your Vehicle

Nav Controls Heading – this points the Vehicle to its next waypoint

Fly tail first – makes the Vehicle drive reverse

Turn take off heading at Home – when drone arrives at home position it orients to its heading right after arming

Wait to reach RTH - this works with RTH altitude command which the drone would climb to the said altitude before initiating the flight to home position

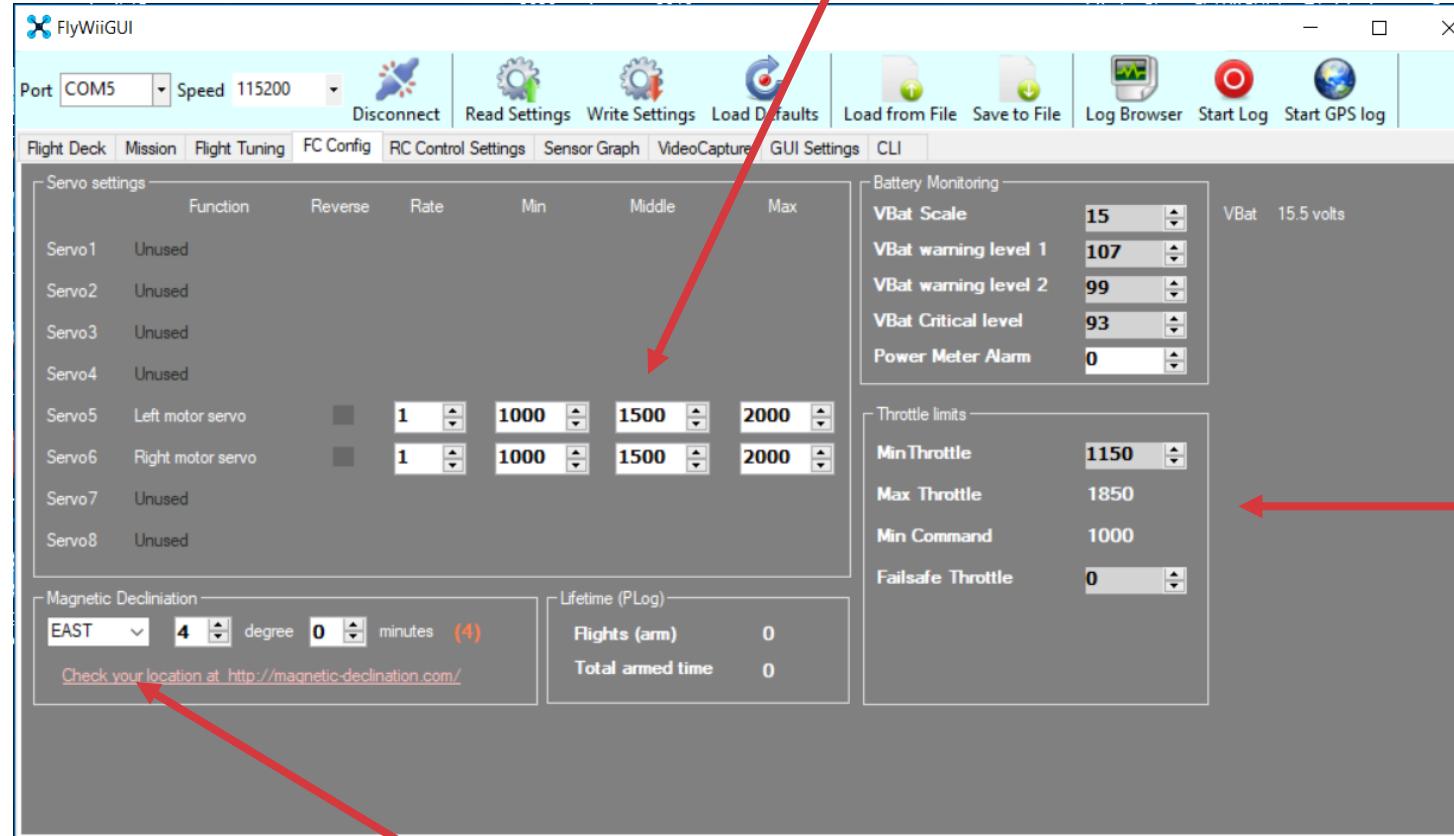

Enable slow navigation – this works with keeping the drone to its **Min Nav speed**

Ignore throttle and Take over Baro – Not applicable

Other Navigation Functions

FC Config

SERVO REVERSE OPTION – IF THE SERVO / REVERSABLE ESCS
IS OPERATING IN THE WRONG DIRECTION FROM CONTROLS

MOTOR THROTTLE RANGE PWM TO THE MOTOR
THIS ALSO CONTROLS THE MOTOR IDLE SPEED ON ARM

IMPORTANT TO KNOW THE MAGNETIC DECLINATION OF YOUR REGION

THIS AID ANY AUTONOMOUS FUNCTION THAT REQUIRES COMPASS

- HEADING HOLD
- GPS HOLD
- RTH
- MISSION

CALIBRATE COMPASS AT THE FLIGHT DECK TAB AFTER SETTING THIS UP

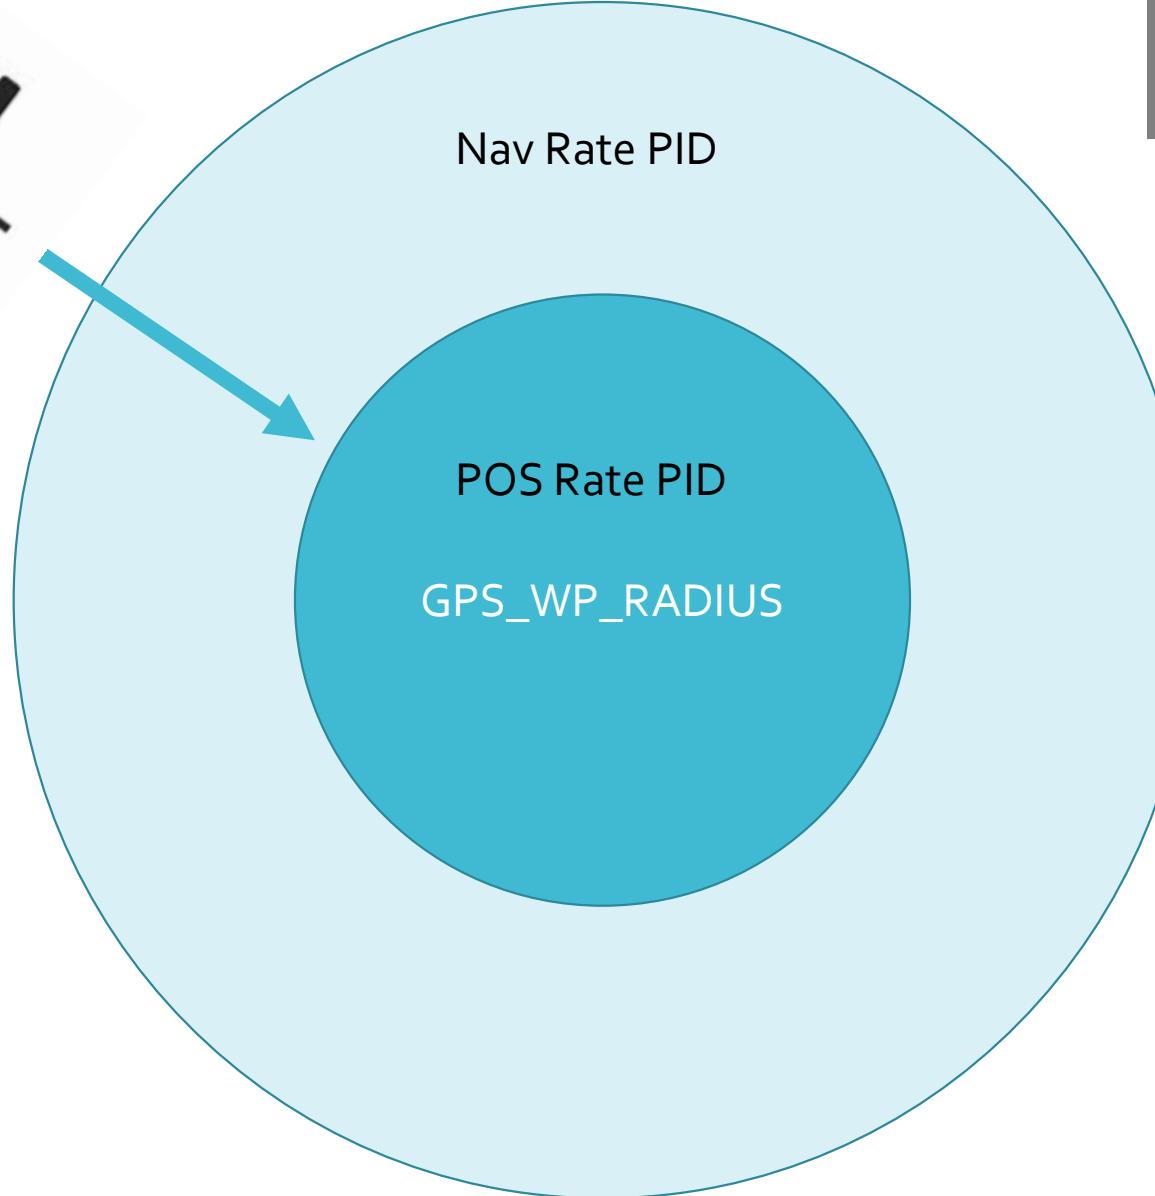

For Mega 2560 + GPS Pos Rate PID controller & Pos Rate PID Tuning

- Pos Rate PID controller
- Pos Rate PID Tuning
- The Pos Rate PID controller takes the commanded speed output from the Pos PI controller and commands an attitude in order to maintain the position hold location. This PID controller should be tuned before adjusting the Pos PI controller.
- The Pos Rate PID settings control how the attitude of the Vehicle is changed in order to move towards the desired hold location.
- The speed of movement is controlled by the Pos PI controller, while the attitude of the Vehicle is controlled by Pos Rate.
- When the Vehicle is within the defined distance of the hold location or waypoint (set by GPS_WP_RADIUS in config.h) the Pos Rate PID is used, when further away from the location the Nav Rate PID is used to return to within the defined waypoint radius.

For Mega 2560 + GPS Pos Rate PID controller & Pos Rate PID Tuning

- The Pos Rate PID controller takes the commanded speed output from the Pos PI controller and commands an attitude in order to maintain the position hold location. This PID controller should be tuned before adjusting the Pos PI controller.
- The Pos Rate PID settings control how the attitude of the Vehicle is changed in order to move towards the desired hold location.
- The speed of movement is controlled by the Pos PI controller, while the attitude of the multirotor is controlled by Pos Rate.
- When the Vehicle is within the defined distance of the hold location or waypoint (set by `GPS_WP_RADIUS` in `config.h`) the Pos Rate PID is used, when further away from the location the Nav Rate PID is used to return to within the defined waypoint radius.

- To tune the Pos Rate PID, initially set P, I and D values to 0.
- Gradually increase P until the Vehicle begins to position hold with some drift.
- Gradually increase D until the Vehicle responds more quickly to undesired changes in attitude caused by the wind. If this value is set too high you will see oscillations or sudden jerking in pitch and roll motion.
- If needed, gradually increase I value to allow the PID controller to compensate for long lasting error, ie if it is being blown by the wind.

PosHold	P 0.15	I 0.00
PosHoldRate	P 3.4	I 0.14 D 0.053
Navigation Rate	P 2.5	I 0.33 D 0.083

The Navigation responds is the vehicle will orientate to the direction of the waypoint It will proceed to drive straight until it reach the WP_Radius and stop With multiple waypoint it will repeat the process till it completes the mission

RC Control Settings

Use Aux switch to setup flight modes and Navigation functions

ARM – this is option should you decided to use a Aux switch oppose to the Combination Stick input to Arm/Disarm Vehicle

BARO – Not applicable

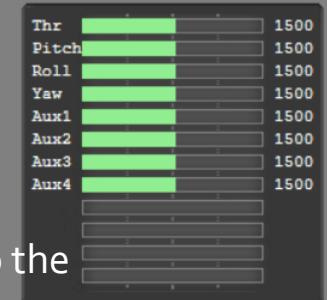

MAG – Heading Hold

HEADFREE – Course Lock regardless of orientation

GPS Home – Return to Home Vehicle returns to where its armed

GPS Hold – Hold Position

MISSION – run a waypoint mission

Live RC data

- Preferably to reserve 1 Aux channel as Arm switch as combination stick could make the vehicle move prematurely
- Then the alternative Aux for the Mission or RTH mode

Missions

Note: Only functional for Mega 2560 Boards with GPS

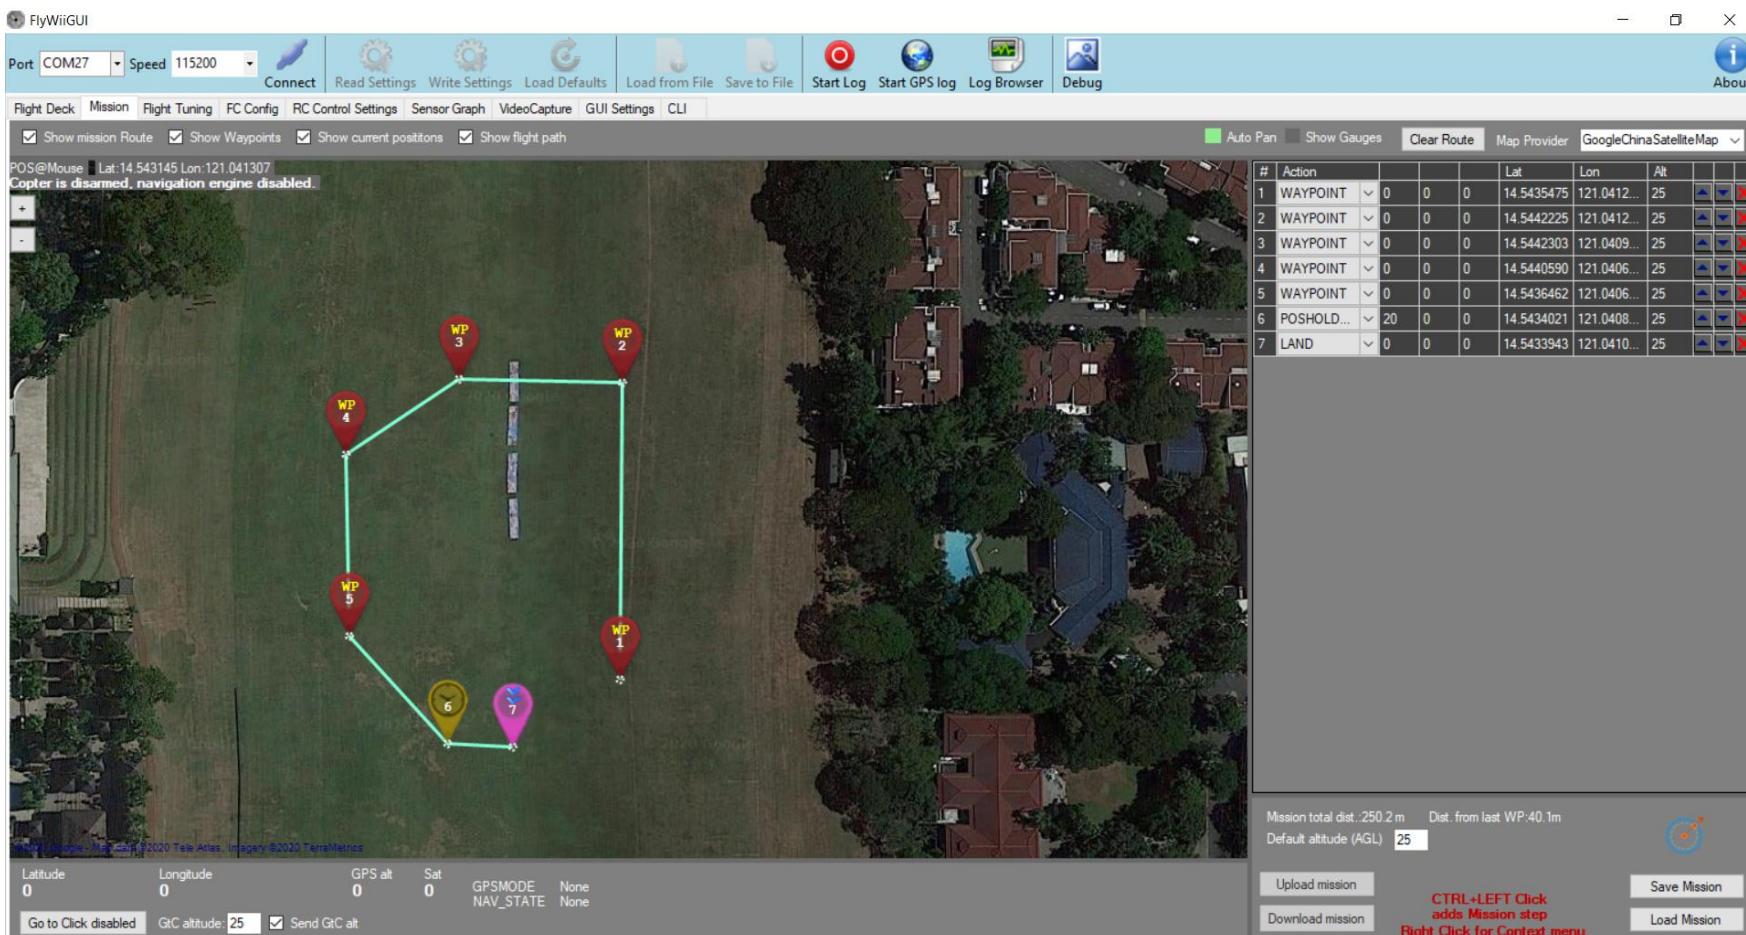

Waypoint – the Vehicle with travel between those points

Time PosHold – Vehicle will wait X number of 00:00:00 then move to the next waypoint

Unlimited PosHold – once the Vehicle reach this point it will hover and wait till you switch out of Mission mode

Land – the Vehicle Stop when has reach this point (Must be place at the end of the mission)

RTH – the Vehicle will go back to home position (Must be place at the end of the mission)

RC Control Setting Tab – activate Baro , Mag , Mission

To start mission takeoff aircraft in stabilize mode up to 1-2meter altitude then switch the aux switch to mission mode .

Any time you can switch out of it on hold or stabilize mode

Missions

Note : GPS require a clear open area to get a proper fix and accuracy minimum 7 satellites but 10+ are Ideal

operating next to a building can distort satellite signal deteriorating accuracy

Which in this case its better to not use GPS modes and operate Manual

And your much Done on your setup

Cannot Arm Motors

when on GPS Home , GPS Hold , Mission Flight modes & when USB is plugged in . (pls use Bluetooth telemetry)

You can Test with the Vehicle's wheels off the ground first

Pls calibrate ACC and Mag in the FlyWii GUI Dashboard

Ensure the compass is facing the correct orientation
